## POINTS TO CONSIDER About Concrete Mixers

### WHEN BUYING A MIXER

the important question is: Will it mix perfect concrete?

It stands to reason that concrete machines having for mixing devices paddles, scoops, shelves,

or blades attached to the inside of the periphery of the mixing receptacle merely pocket as much as they will hold of some ingredient as it enters the chamber and carry it around, cutting through but not mixing with the main mass of material at the bottom of the receptacle, and this ingredient carried by these devices is not removed or mixed, but simply slides out when the batch is discharged.

### THE CHICAGO IMPROVED CUBE CONCRETE MIXER

has no inside scoops or paddles - no contents except breaker rods; the cube does the work.

At 15 revolutions per minute the entire mass is thrown from side to side and broken over the breaker rods 90 times.

There are no pockets to separate the ingredients, no possibility of clogging or balling up. The entire batch must be evenly mixed, insuring perfect concrete.

THE CHICAGO HAS FEWEST NUMBER OF PARTS.

REQUIRES LEAST TIME TO MIX.

INSURES ABSOLUTE UNIFORMITY OF CONCRETE.

Sizes and mountings for every requirement. Write for catalogue No. 10.

### PERISTYLE SHOWING MILLWORK OF OUR MANUFACTURE

This picture shows a general view of a magnificent Peristyle. The cut is necessarily so reduced in size that the massiveness of the structure is not apparent at first sight. The brackets upon the cornice are 11 x 14 inches and 2 feet long. The cornice from top of crown moulding to soffit is 4 feet 6 inches in height.

The Rustication work in the angle between Pilasters at the base of this tower is entirely of wood, the large coves and rounds shown there requiring lumber 6 x 14 and 4 x 12. The Paneled Entablatures on the Tower above Colonnade Cornice are each 20 x 15 feet and were completed entire at our Chicago factory ready to be set in place in the building. The owners of this structure say: "Every part of the work has been critically inspected. When the various parts were delivered by True & True Co. it was found that they fitted to a nicety. Each piece was technically perfect."

# Preface

---

THE architects, engineers and builders of Chicago had long felt the need of some sort of handbook containing a statement of public laws, practice and technical rules and tables particularly pertaining to local and state building. Being especially impressed with the needs of the field, the first edition of this handbook was published nine years ago. The book has been issued annually ever since, much to the satisfaction of both local architects and those throughout the state, as is evidenced by the hundreds of letters of commendation which we have received from architects. The value of the work has been greatly increased by its careful annual revision. Laws and practice are constantly changing, new and improved methods of construction are continually being introduced, and ordinary architects' reference books are thus out of date very shortly after publication, and, being intended to meet the needs of all communities, are not well adapted for local use. Hence our reason for existence.

The building ordinances of the City of Chicago were completely revised March 20, 1905, and have been published. We now republish them with all of the amendments which have been added, to time of going to press. We are also publishing complete, this year, the laws of the Sanitary Department of Chicago, with all amendments to same.

By request, we have indexed our items of miscellaneous and useful information separately, to which we have added many rules, tables, drawings, examples and other valuable information.

Much interesting and educational matter will be found in this edition, such as lectures given before the Chicago Architects' Business Association during the year by prominent men in various building lines. Particular attention is called to the article by Prof. N. Clifford Ricker of the University of Illinois, giving formulas and rules for simple base plates for columns.

Since the architectural orders have appeared for some years past and many other matters of importance have been added, it has been deemed wise to omit these from this issue of the work.

We gratefully acknowledge the many valuable suggestions offered by architects and others, for the improvement of the handbook, and have endeavored to embody these in this work.

# Those Plans Mr. Architect

Good  
Roof

Poor  
Wall  
Plaster

*"A chain is no stronger than its weakest link"*

THOSE PLANS, MR. ARCHITECT, for that new building are not complete—not up to your high standard—not up to your reputation—until you specify

## ADAMANT

THE PERFECTION OF WALL PLASTER.

A structure with first class materials in every other detail but without the best modern Hard Wall Plaster is a chain with a weak link. Why build a good superstructure, good foundation, and neglect the very heart of home and business comfort—the interior walls? You know, without argument, the trouble, the expense, the inconvenience, the disappointment—caused by weak, crumbly wall plaster which is not proof against weather, water, fire, short circuitings and the like. It's like the man who boasted of his new house with a "Queen Anne Front," but whose neighbors laughed at its "Mary Ann Back."

All this you can avoid—positively—with the "U. S. G." brands of Hard Wall Plaster. But if you want the finest results that can be produced—and wish to please the contractor, the workman, and the owner alike—you will specify ADAMANT, the perfection of Wall Plaster.

*"Adamant" is so convenient*—all ready prepared for the wall—nothing to add but water. And there's an "Adamant" for every plaster purpose—base coat for lath—base coat for brick—finish coats—etc., etc.

*"Adamant" is so sure.* You see, there's no chance for the plasterer to go wrong. He can't mix it wrong—for the mixing is already done. He can't misinterpret your wishes—he simply follows specifications.

*So easy to specify.* We make it easy and convenient for you to specify "Adamant"—without any bother or worry, or chance of mistake. Won't you let us explain to you how we do it?

Consult with us on the plaster item in the plans for your next structure.

A postal or 'phone inquiry will promptly bring all desired information, in a pleasant, courteous way.

Give us your confidence. We will guarantee to retain it.

# Chicago Architects' Business Association

Organized, January 12, 1897. Incorporated, June 25, 1897.

He who has been editor and secretary for nine successive years has laid down his pen and passed beyond. He labored faithfully and well. Would that the fraternal spirit which dominated him might actuate every architect. He loved much and was much loved. He sacrificed much and the profession gained. He learned early that public benefit was synonymous with general advancement and he helped to shape the policy of the Architects' Association accordingly. His task has fallen into inexperienced hands. We need your consideration and support.

The architect is a citizen, and as such is under obligation to contribute his share toward the common good. The citizen's support of the state should be along the line of his greatest efficiency. By training and experience, the architect is familiar with all practical conditions pertaining to the construction and administration of buildings. He understands the operation and effect of public laws relative to buildings. He understands the consequences of careless or unintelligent enforcement of building laws and the technical necessities which should be observed in the promulgation of these laws. As a citizen, his duty to the community requires him to see that the laws proposed and enacted by legislators are well and carefully considered from all standpoints, and are so worded as to be unequivocal and readily enforced. Bad laws should be repealed, not used for the reward of friends and punishment of enemies. Executive officers are powerless under a republican form of government unless backed by the moral support of the majority of citizens, particularly of the most intelligent.

The policy of the Chicago Architects' Business Association has been to unify the profession of this city in a common support of all good building laws and in an effort to have repealed all incorrect and inefficient laws and to secure on the part of executive officers, of both city and state, a just and uniform enforcement of all laws on the statute books pertaining to buildings. Its committee on public action has devoted much time and effort toward bringing about desirable results.

It has long been felt that one of the greatest causes leading to the violation of building laws has been the disposition on the part of the people engaged in construction to avoid responsibility for violations. This evasion has been possible through a distribution of responsibility between the architect, owner, owner's agent, contractor and sub-contractor, making it almost impossible for the public officer to find the real offender. If the responsibility is placed on either owner, real estate agent or contractor, a plea of ignorance can be, and usually is, offered as an excuse for improper or unlawful construction. Because of the Architects' License Law in this state, such a plea on the part of the architect cannot be entered, for he is supposed to understand construction and the law. But if the architect does not supervise the execution of his plans and specifications he cannot be held responsible for results, as it would be difficult to prove that these had been followed exactly and to the letter. It is also true that unanticipated conditions are likely to occur in the erection of any structure which would cause a modification of plans, and such emergencies can only be properly met under the administration of a technically skilled architectural superintendent of construction. The reported violations of the building laws of the city show that over 90 per cent of all violations reported to the department are on those buildings which have been erected without the supervision of an architect.

Much time in the past has been consumed by the Building Department of the city in furnishing technical information to unskilled builders, thus using public officers for the benefit of private individuals. The department should only be charged with the expense of seeing that the laws are followed. Realizing this growing evil, and in co-operation with the Commissioner of Buildings, an attempt was recently made by this Association to secure the passage of a law requiring the supervision of all buildings erected in the city by an expert and placing the responsibility for all violations of law upon this expert, so that in case of violation there would be no difficulty in finding the guilty party. Unfortunately the city council has not yet been persuaded to agree with us! However, an ordinance has been passed which permits the architect to submit his plans for approval preceding the application for a building permit proper. It is now made feasible for him to know the exact interpretation of the department on his work in advance of the letting of contracts, so that in case of difference in interpretation he may correct his plans before having them printed or involving his client in contracts with contractors which must be modified, often requiring extra work and expense. This is a movement in the right direction and we hope before another year has passed that the reform so much needed in placing the responsibility for supervision of buildings will be an accomplished fact.

Efforts have been made to secure a more uniform size for printed matter to be distributed to architects, facilitating filing and classification.

A joint committee has been appointed to confer with a like committee from the American Institute of Architects to determine the feasibility and desirability of legalizing the projection of decorative features of buildings over public street and alley lines. This movement has been brought about by the discovery that under the state constitution a private property owner has no right to appropriate to his personal use the space occupied by public thoroughfares from the earth to the sky, and that all private building projections extending over such thoroughfares are illegal and that the state has the right to order these removed at any time. The committee charged with this duty has not completed its labors.

This only serves to illustrate the fallacy of accepting, either expressed or implied, permission on the part of public officials to violate laws as legalizing same. No act of an executive official can change law or its consequences.

The regular meetings of the Association have been attended by constantly increasing numbers during the past year, and on the memorable event of "A trip through the tunnel" some five hundred architects and friends were conducted through it by Mr. Geo. W. Jackson, the engineer of the Illinois Tunnel Company, who addressed the meeting, after the dinner served by the Association to its members and guests. On other special occasions the Association has been addressed upon subjects of practical interest to the profession. Mr. A. G. Johnson, chief designer for the Link Belt Machinery Company, discussed "Hoisting and Conveying Machinery;" Mr. James R. Cravath, editor of the Electrical World, explained "Correct Illumination," illustrated by the stereopticon, and Dr. Toch of New York told about waterproofing of buildings and its importance.

These lectures were most instructive and entertaining. While space does not permit a complete publication of these valuable papers, we have attempted to give elsewhere the complete substance of same, which is well worthy the perusal of our readers. Lack of space also prevents dwelling more upon matters that the Association has under consideration. It is sufficient to say that these are numerous, important and of vital interest to all those who are interested in the advancement of the architectural profession.

# Schedule of Charges for Professional Services

## Recommended by the

### Chicago Architects' Business Association

---

The architect's professional services consist in preparing the necessary preliminary studies, working drawings, specifications, large scale and full-size details, and in the general direction and supervision of the work, for which the minimum charge is five per cent upon the cost.

For new buildings, costing less than ten thousand dollars, and alterations and repairs, and for furniture, monuments, decorative and cabinet work, it is usual and proper to charge a special fee in excess of the above.

Consultation fees for professional advice are to be paid in proportion to the importance of the questions involved.

None of the charges above enumerated cover alterations and additions to contracts, drawings and specifications, nor professional or legal services incidental to negotiations for site, disputed party walls, right of light, measurement of work, or failure of contractors. When such services become necessary, they shall be charged for according to the time and trouble involved.

Where heating, ventilating, mechanical, electrical and sanitary problems in a building are of such a nature as to require the assistance of a specialist, the owner is to pay for such assistance. Chemical and mechanical tests, when required, are to be paid for by the owner.

Necessary traveling expenses are to be paid by the owner.

Drawings and specifications, as instruments of service, are the property of the architect.

The architect's payments are due as his work progresses in the following order: Upon completion of the preliminary sketches, one-fifth of the entire fee; upon completion of working drawings and specifications, two-fifths; the remaining two-fifths being due from time to time in proportion to the amount of work done by the architect in his office and at the building.

Until an actual estimate is received, the charges are based upon the proposed cost of the work, and payments are received as installments of the entire fee, which is based upon the actual cost to the owner of the building or other work, when completed, including all fixtures necessary to render it fit for occupation. The architect is entitled to extra compensation for furniture or other articles purchased under his direction.

If any material or work used in the construction of the building be already upon the ground or come into the owner's possession without expense to him, its value is to be added to the sum actually expended upon the building before the architect's commission is computed.

In case of the abandonment or suspension of the work, the basis of settlement is as follows: Preliminary studies, a fee in accordance with the character and magnitude of the work; preliminary studies, working drawings and specifications, three-fifths of the fee for complete services.

The supervision of an architect (as distinguished from the continuous personal superintendence which may be secured by the employment of a Clerk-of-Works) means such inspection by the architect, or his deputy, of work in studios and shops, or of a building or other work in process of erection, completion or alteration, as he finds necessary to ascertain whether it is being executed in conformity with his drawings and specifications or directions. He is to act in constructive emergencies, to order necessary changes and to define the true intent and meaning of the drawings and specifications, and he has authority to stop the progress of the work and order its removal when not in accordance with them.

On buildings where the constant services of a superintendent are required, a Clerk-of-Works shall be employed by the architect at the owner's expense.

## AN ACT

### TO PROVIDE FOR THE LICENSING OF ARCHITECTS AND REGULATING THE PRACTICE OF ARCHITECTURE AS A PROFESSION.

---

Enacted by the Fortieth General Assembly at the Regular Biennial Session, Approved June 3, 1897, and in Force July 1, 1897; with Amendments Adopted by the Forty-first and Forty-fourth General Assemblies. In Force July 1, 1905.

---

**Section 1. Appointment of a State Board of Examiners of Architects.** — *Be it enacted by the People of the State of Illinois, represented in General Assembly, That within thirty days after the passage of this act the Governor of this State shall, by the advice and consent of the Senate, appoint a State Board of Examiners of Architects, to be composed of five members, one of whom shall be a member of the faculty of the Illinois State University, and the other four shall be architects residing in the State of Illinois, who have been engaged in the practice of architecture at least ten years. Two of the said practicing architects appointed as examiners shall be designated to hold office for two years from the date of the passage of this act, and the other two, together with the member of the faculty aforesaid, shall hold office for four years from the passage of this act; and thereafter, upon the expiration of the term of office of the person so appointed, the Governor of the State shall appoint a successor to each person whose term of office shall expire, to hold office for four years, and said person so appointed shall have the above specified qualifications. In case appointment of a successor is not made before the expiration of the term of any member, such member shall hold office until his successor is appointed and duly qualified. Any vacancy occurring in membership of the board shall be filled by the Governor of the State for the unexpired term of such membership.*

**Sec. 2. Examiners to file Oath of Office with the Secretary of State — Treasurer to file Bond—Salary of Secretary and Members of Board of Examiners.**—The members of the State Board of Examiners of Architects shall, before entering upon the discharge of their duties, make and file with the Secretary of State the constitutional oath of office. They shall, as soon as organized, and annually thereafter, in the month of January, elect from their number a president and secretary, who shall also be the treasurer. The treasurer, before entering upon his duties, shall file a bond with the Secretary of State, for such sum as shall be required of him by said Secretary of State, and in such form and with such securities as may be approved by the Governor of the State. The board shall adopt rules and regulations not inconsistent with this act to govern its proceedings, and also a seal; and the secretary shall have the care and custody thereof; and he shall keep a record of all the proceedings of the board

which shall be open at all times to public scrutiny, and the board shall cause the prosecution of all persons violating any of the provisions of this act, and may incur necessary expenses in that behalf.

The secretary of the board shall receive a salary which shall be fixed by the board, and which shall not exceed the sum of fifteen hundred (1,500) dollars per annum; he shall also receive his traveling and other expenses incurred in the performance of his official duties. The other members of the board shall receive the sum of ten (10) dollars for each day actually engaged in this service, and all legitimate and necessary expenses incurred in attending the meetings of said board. Said expenses shall be paid from the fees received by the board under the provisions of this act, and no part of the salary or other expenses of the board shall be paid out of the State treasury. All moneys received in excess of the said per diem allowance and other expenses provided for, shall be held by the treasurer as a special fund for meeting the expenses of said board, and the cost of an annual report of the proceedings of the State Board of Examiners of Architects. And any moneys that may have been heretofore paid into the State treasury to the credit of said board are hereby appropriated to the said board, to be held by it as a part of said special fund; and the Auditor of Public Accounts is hereby authorized to issue a warrant for their repayment on the requisition of said board and the approval of the Governor, in such amounts as may from time to time be required.

**Sec. 3. Quorum - Meetings of Board - Rules and Regulations.** - Three members of the board shall constitute a quorum. Special meetings of the board shall be called by the secretary upon the written request of any two members, by giving at least seven days' written notice of the meeting to each member, reckoning from the day on which the notices are postmarked, telegraphed or personally delivered. The board shall adopt rules and regulations for the examination of applicants for license to practice architecture, in accordance with the provisions of this act, and may amend, modify and repeal such rules and regulations from time to time. The board shall, immediately upon the election of each officer thereof, and upon the adoption, repeal or modification of its rules of government or its rules and regulations of examinations of applications for licenses, file with the Secretary of State, and publish in at least one architectural journal and one daily newspaper published in the State of Illinois, at least twice, the name and address of each officer, and a copy of such rules and regulations, or the amendments, repeal or modification thereof.

**Sec. 4. Examinations - Applicants for License to Pay a License Fee of \$15 - License Fee, \$25.** - Provision shall be made by the board hereby constituted for holding examinations, at least twice in each year, of applicants for license to practice architecture, and any person over twenty-one years of age, upon payment of a fee of fifteen dollars (\$15) to the secretary of the board, shall be entitled to an examination for determining his or her qualifications. All examinations shall be made directly by said board, or a committee of two members delegated by the board, and due notice of the time and place of the holding of such examinations shall be published, as in the case provided for the publication of the rules and regulations thereof. The examination shall have special reference to the construction of buildings, and a test of the knowledge of the candidate of the strength of materials, and of his or her ability to make practical application of such knowledge in the ordinary professional work of an architect, and in the duties of a supervisor of mechanical work on buildings, and should also seek to determine his or her knowledge of the laws of sanitation as applied to buildings. If the result of the examination of any applicant shall be satisfactory to a majority of the board, under its rules, the secretary shall, upon an order of the board, issue to the applicant a certificate to that effect, and upon payment to the secretary of the board by the candidate of a fee of twenty-five dollars (\$25), he shall thereupon issue to the person therein named a license to practice architecture in the State, in accordance with the provisions of this act, which license shall contain the full name, birth-place and age of the applicant, and be signed by the president and secretary, and sealed with the seal of

the board. If an applicant fails to pass said examination his or her fee shall be returned.

All papers received by the secretary in relation to applications for license shall be kept on file in his office, and a proper index and record thereof shall be kept by him.

**Sec. 5. Architects Who are Entitled to License Without an Examination.**—Any person who shall, by affidavit, show to the satisfaction of the State Board of Examiners of Architects that he or she was engaged in the practice of the profession of architecture on the date of the passage of this act, shall be entitled to a license without examination, provided such application shall be made within six months after the passage of this act. Such license, when granted, shall set forth the fact that the person to whom the same was issued was practicing architecture in this State at the time of the passage of this act, and is, therefore, entitled to a license to practice architecture without an examination by the Board of Examiners, and the secretary of the board shall, upon the payment to him of the fee of twenty-five dollars (\$25), issue to the person named in said affidavit a license to practice architecture in this State, in accordance with the provisions of this act. In the case of a copartnership of architects, each member whose name appears must be licensed to practice architecture. No stock company or corporation shall be licensed to practice architecture, but the same may employ licensed architects. Each licensed architect shall have his or her license recorded in the office of the county clerk in each and every county in this State, in which the holder thereof shall practice, and he or she shall pay to the clerk the same fee that is charged for the recording of notarial commissions. A failure to have his or her license so recorded shall be deemed sufficient cause for revocation of such license.

**Sec. 6. County Clerks to Keep Record of Licenses Recorded.**—Each county clerk shall keep in a book, provided for the purpose, a complete list of all licenses recorded by him under the provisions of this act, together with the date of the issuance of each license.

**Sec. 7. Licensed Architects to Have a Seal.**—Every licensed architect shall have a seal, the impression of which must contain the name of the architect, his or her place of business, and the words "Licensed Architect," "State of Illinois," with which he shall stamp all drawings and specifications issued from his office for use in this State.

**Sec. 8. Penalty for Practicing Architecture Without a License.**—After six months from the passage of this act it shall be unlawful, and it shall be a misdemeanor punishable by fine of not less than ten dollars (\$10) nor more than two hundred dollars (\$200) for each and every offense, for any person to practice architecture without a license in this State, or to advertise, or to put out any sign or card or other device which might indicate to the public that he or she is entitled to practice as an architect.

**Sec. 9. Persons Who Are to be Regarded as Architects.**—Any person who shall be engaged in the planning or supervision of the erection, enlargement or alteration of buildings for others, and to be constructed by other persons than himself, shall be regarded as an architect within the provisions of this act, and shall be held to comply with the same; but nothing contained in this act shall prevent the draftsmen, students, clerks of works or superintendents, and other employes of those lawfully practicing as architects, under license as herein provided for, from acting under the instruction, control or supervision of their employers; or shall prevent the employment of superintendents of buildings paid by the owners from acting, if under the control and direction of a licensed architect who has prepared the drawing and specifications for the building. The term building in this act shall be understood to be a structure, consisting of foundations, walls and roof, with or without the other parts; but nothing contained in this act shall be construed to prevent any person, mechanic or builder from making plans and specifications for, or supervising the erection, enlargement or alteration of any building that is to be

constructed by himself or employes, nor shall a civil engineer be considered as an architect unless he plans, designs and supervises the erection of buildings, in which case he shall be subject to all the provisions of this act, and be considered as an architect.

**Sec. 10. License Revoked.**—Architects' licenses issued in accordance with the provisions of this act shall remain in full force until revoked for cause, as hereinafter provided. Any license so granted may be revoked by unanimous vote of the State Board of Examiners of Architects for gross incompetency, or recklessness in the construction of buildings, or for dishonest practices on the part of the holder thereof, but before any license shall be revoked such holder shall be entitled to at least twenty days' notice of the charge against him, and of the time and place of the meeting of the board for the hearing and determining of such charge. And on the cancellation of such license it shall be the duty of the secretary of the board to give notice of such cancellation to the county clerk of each county in the State in which the license has been recorded, whereupon the clerks of the counties shall mark the license recorded in his office canceled. After the expiration of six months from the revocation of a license, the person whose license was revoked may have a new license issued to him by the secretary upon certificate of the Board of Examiners, issued by them upon satisfactory evidence of proper reasons for his reinstatement, and, upon payment to the secretary of the fee of five dollars (\$5).

For the purpose of carrying out the provisions of this act relating to the revocation of licenses, the board shall have the power of a court of record, sitting in the county in which their meeting shall be held, and the power to issue subpoenas and compel the attendance and testimony of witnesses. Witnesses shall be entitled to the same fees as witnesses in a court of record, to be paid in like manner. The accused shall be entitled to the subpoena of the board for his witnesses, and to be heard in person or by counsel in open public trial.

**Sec. 11. Renewal of Licenses.**—Every licensed architect in this State who desires to continue the practice of his profession shall annually, during the time he shall continue in such practice, pay to the secretary of the board during the month of July a fee of five dollars (\$5), and the secretary shall thereupon issue to such licensed architect a certificate of renewal of his license for the term of one year. Any licensed architect who shall fail to have his license renewed during the month of July in each and every year shall have his license revoked; and it shall be the duty of the secretary of the board to give notice of such revocation to the county clerk in each county in the state, whereupon the clerks of the counties shall make an entry of such revocation accordingly.

But the failure to renew said license in apt time shall not deprive such architect of the right to renewal thereafter; and the secretary of the board shall give like notice of such renewal; but the fee to be paid upon the renewal of license after the month of July shall be ten (10) dollars, to cover the additional expense incurred by the board on account of such notices.

**Sec. 12. Report of Proceedings to be Filed with the Auditor of Public Accounts.**—Within the first week of December, after the organization of the board, and annually thereafter, the secretary of the board shall file with the Auditor of the State a full report of the proceedings of the board, and a complete statement of the receipts and expenditures of the board, attested by the affidavits of the president and secretary, subject to the approval of the State Auditor.

# FRIEDLEY-VOSHARDT CO.

INC.  
194-204 Mather Street, Chicago

MANUFACTURERS OF

Art Metal Ceiling,

Architectural Ornaments,

Zinc and Bronze Statuary, Finials, Crestings, etc.  
Roofing and Galvanized Iron, Sheet Copper, Steel Tanks,  
Steel Signs, Crescent Ventilators.

## PRONG LOCK WIRELESS STEEL STUDS AND FURRING

for any style expanded or wire lath.

"It's a cinch to clinch the prongs on the prong lock wireless studs"

The prongs are punched straight out from the studs. Hang the lath on the prongs, clinch them back with the tap of a hammer and the job is ready to plaster. They save half the labor cost.

GET POSTED! WRITE!

## Hydrolithic Waterproofing

**PERMANENT AS THE PYRAMIDS**

Go deep as you please with your sub-cellars or tunnels and don't worry about water or dampness.

### Results Guaranteed

(1) No pumping year in and year out. (2) No paper, cloth or vegetable ingredient to decompose. (3) No supporting structure required or desired to hold in place the waterproofing medium. (4) Applied upon inside of cellars saves cost of excavation, while perfect results are attained. (5) Adds strength and durability to whatever it is applied.

A comprehensive description to be found in "Sweet's Index," at the office of any architect.

### HYGIENIC KALSOMINE Most Artistic and Sanitary Decoration FOR WALLS AND CEILINGS

ONE MILLION POUNDS USED YEARLY IN CHICAGO

Very economical for all uses. Those acquainted with it will use no other, because it is the most beautiful, the most durable and the most economical. One pound will cover one hundred square feet on an average wall, and is equally as well adapted to the smallest room in the private home as the largest hall or public building. It contains great sanitary properties, and any wall finished with it is also thoroughly purified.

The Board of Education of Chicago, fully appreciating the above merits in **HYGIENIC KALSOMINE**, always specify it for their school buildings.

In 1902, twenty contractors re-decorated ninety school buildings. Sixteen of them, or eighty per cent, used **HYGIENIC KALSOMINE**.

In 1903, twenty-seven contractors re-decorated one hundred and nine school buildings. Twenty of these contractors again used **HYGIENIC KALSOMINE**.

In 1904 and 1905, within 3 days after contracts were let, seventy-five per cent of the contractors bought **HYGIENIC KALSOMINE** for eighty-two per cent of the schools.

For sample colors, special schemes and designs for schools public buildings, etc., as well as prices and other information, address

# BUILDING ORDINANCES OF THE CITY OF CHICAGO

As Passed March 13, 1905 and as Amended by the Revised Municipal Code  
Passed March 20, 1905.

*All amendments and additions to the Municipal Code relating to Building passed up to date of going to press will be found printed in italics under proper section numbers.*

The sections as herein numbered are in the same order as they appear in the ordinance of March 13, 1905. The corresponding numbers used in the "Code" will be found at the bottom of every page.

## CHAPTER FIFTEEN.

### ARTICLE I.

#### OFFICERS—POWERS AND DUTIES.

Section 1. (**Department of Buildings Established.—Officers.**)—There is hereby established an executive department of the municipal government of the city, which shall be known as the Department of Buildings, and shall embrace a Commissioner of Buildings, a Deputy Commissioner of Buildings, an Assistant Deputy Commissioner of Buildings, a Civil Engineer, a Secretary to the Commissioner, a Chief Building Inspector, and such Inspectors of Elevators, Inspectors of Stand Pipes and Fire Escapes, and Inspectors of Buildings, and such other assistants and employes as the City Council may by ordinance provide.

Sec. 2. (**Building Commissioner.—Office Created.—Appointment.—Bond.**)—There is hereby created the office of Commissioner of Buildings. He shall be the head of said Department of Buildings, and shall be an experienced architect, civil engineer, builder, or competent building mechanic, and shall have been engaged in the city as an architect, civil engineer, builder or building mechanic for a period of ten years, and during his term of office as Commissioner of Buildings, he shall not be engaged in any other business.

He shall be appointed by the Mayor, by and with the advice and consent of the City Council.

Sec. 3. (**Bond.**)—The Commissioner of Buildings before entering upon the duties of his office shall execute a bond to the city in the sum of twenty-five thousand (\$25,000) dollars, with such sureties as the City Council shall approve, conditioned for the faithful performance of the duties of his office.

Sec. 4. (**Powers.—Appointment of Subordinates.—Bonds.—Duties of Commissioner.**)—He shall have the management and control of all matters and things pertaining to the Department of Buildings, and shall appoint, according to law, all subordinate officers and assistants in his department and may remove them according to law. All subordinate officers, assistants, clerks and employes in said Department shall be subject to such rules and regulations as shall be prescribed from time to time by said Commissioner.

Sec. 5. (**Ordinances.—Enforcement of.**)—It shall be the duty of said Commissioner to enforce all ordinances relating to the erection, construction, alteration, repair, removal or the safety of buildings.

Sec. 6. (**Precautions in Behalf of Public Safety.—May Require Repair or Alteration in Such Cases.**)—It shall be the duty of the Commissioner of Buildings, when any citizen represents that ashes or combustible materials are kept in any place in the city in an insecure manner, or that the doors, stairways, corridors, exits or fire escapes in any factory or workshop or other place of employment are insufficient for the escape of employes in case of fire, panic or accident, or do not comply with the provisions of this chapter; or that the funnels, flues, fire boxes or heating apparatus in any building in the city are insecure or dangerous, or that any part of any building in the city is in an unsafe or dangerous condition, or in any wise in contravention of this chapter, to make an examination of such place of building, and if such representation

is found to be true, said Commissioner shall give notice in writing to the owner, occupant, lessee or person in possession, charge or control of such place or building to make such changes, alterations or repairs as public safety or the ordinances of the city may require; and it shall be unlawful to continue the use of such building until the changes, alterations or repairs found necessary by the Commissioner of Buildings to make such building or part thereof safe or to bring it into compliance with this chapter, shall have been made.

**Sec. 7. (Inspection of All Buildings in General Use.—Must Report All Unsafe Conditions.)**—The Commissioner of Buildings shall inspect or cause to be inspected all public school buildings, public halls, churches, theaters and all buildings used either for manufacturing or commercial purposes, also all hotels, apartment houses and other buildings occupied by large numbers of people, for the purpose of determining the safety of such buildings, or any parts or appliances or equipment thereof; sufficiency of their doors, passageways, aisles, stairways, corridors, exits or fire escapes and generally their facilities for egress in case of fire or other accident, and the strength of their floors, and shall make returns of all violations of the several provisions of this chapter to the Law Department for prosecution.

**Sec. 8. (Interpretation of this Chapter.)**—The Commissioner of Buildings shall have full power to pass upon any question arising under the provisions of this chapter, subject to the conditions, modifications and limitations contained therein.

**Sec. 9. (Inspection of Elevators.—Power to Stop Use of Same.)**—The Commissioner of Buildings shall have power to prohibit and stop the use of any passenger or freight elevator when any Inspector of Elevators shall report to him that such elevator or the hoistway in which it is used is in a dangerous or unsafe condition. Such prohibition of use shall continue in force until such hoistway or elevator, or both, shall have been put in a safe condition, and certified to be safe after a proper inspection thereof by the Inspector of Elevators.

**Sec. 10. (Buildings Found in Unsafe Condition.—Notice to Owner.—Authority of Commissioner.)**—If the Commissioner of Buildings shall find in the city any building or structure or part thereof in such an unsafe condition as to endanger life, but so that, by the immediate application of precautionary measures such danger may be averted, he shall have authority, and it shall be his duty to forthwith notify in writing, the owner, agent, or person in possession, charge or control of such building or structure or part thereof to adopt and put into effect such precautionary measures as may be necessary or advisable in order to place such building or structure or part thereof in a safe condition. Such notice shall state briefly the nature of the work required to be done, and said Commissioner shall specify in such notice a time within which the work required to be done shall be completed by the person notified, such time to be fixed by said Commissioner upon taking into consideration the condition of such building or structure, or part thereof, and the danger to life or property which may result from its unsafe condition.

If the owner, agent or person in possession, charge or control of such building or structure, or part thereof, when so notified, shall fail, neglect or refuse to place such building or structure, or part thereof, in a safe condition, and to adopt such precautionary measures as shall have been specified by said Commissioner within the time specified in such notice, in such case, at the expiration of such time, it shall be the duty of said Commissioner to proceed forthwith to do, or cause to be done, any and all work necessary to place such building or structure, or part thereof, in a safe condition.

If the said commissioner shall be unable to find the owner of such building, structure, or part thereof, or any agent or person in possession, charge or control thereof, upon whom such notice may be served, he shall place or cause to be placed the notice herein provided for, upon such building at or near its principal entrance, and if, at the expiration of the time specified in such notice for the completion of the work required to be done the terms of such notice shall not have been complied with, it shall be the duty of the Commissioner to thereupon proceed and do such work in the same manner as has hereinbefore been provided in cases of refusal, neglect or failure on the part of the owner, agent or person in possession, charge or control of any such building, structure or part thereof, when so notified.

If, in accordance with the provisions of this section, the work of placing any building, structure, or part thereof in a safe condition shall devolve upon the said commissioner, and it shall appear that such building, structure or part thereof is in such a condition as not to warrant the expenditure thereon of a sufficient sum of money to make such repairs or to do such work as is necessary to put it in a safe condition, the said Commissioner shall have authority to tear down or destroy such building or structure or part thereof, and the expense of tearing down and destroying any such

building or structure or part thereof, and the expense of making any repairs or doing any work thereon shall be charged to the person owning or in possession, charge or control of such building or structure or part thereof, and the Commissioner shall recover or cause to be recovered from such owner or person in possession, charge or control the cost to the city of doing such work.

**Sec. 11. (Building or Part of Building Constructed in Violation of Chapter.—Authority of Commissioner to Tear Down.)**—If it shall be found that any building or structure or part thereof is being or shall have been constructed or built in violation of any of the provisions of this chapter, the Commissioner of Buildings shall forthwith notify the owner, agent, superintendent or architect of, or the contractor engaged in erecting such building or structure, or part thereof, of the fact that such building or structure, or part thereof, has been, or is being, constructed or erected contrary to the provisions of this chapter, and shall specify briefly in such notice in what manner the provisions of this chapter, or any of them, have been violated, and shall require the person so notified to forthwith make such building, structure, or part thereof, conform to and comply with the provisions of this chapter, specifying in such notice the time within which such work shall be done.

If, at the expiration of the time set forth in such notice, the person so notified shall have refused, neglected or failed to comply with the request made in such notice and to have such building or structure, or part thereof, concerning which notice was sent, changed so as to conform to and comply with the provisions of this ordinance, the Commissioner of Buildings shall have the authority, and it shall be his duty, to proceed forthwith to tear down or cause to be torn down such building or structure, or such part thereof as shall or may have been erected and constructed in violation of the provisions or any of the provisions of this chapter, and the cost of such work shall be charged to and recovered from the owner of such building or structure or from the person for whom such building or structure is being erected.

**Sec. 12. (May Direct Fire Department to Remove.)**—The Commissioner of Buildings shall also have authority to direct the Fire Department, after written notice has been served upon the owner, lessee, occupant, agent or person in possession, charge or control, personally, to tear down any defective or dangerous wall or any building or any part thereof which may be constructed in violation of the terms of this chapter. In case of the destruction, or partial destruction, of buildings by fire or by the action of the elements, when any department of the city government, pursuant to the ordinances of the city, shall make any outlay of money or incur any liability for the payment of any expense on behalf of the city in an effort to preserve or prevent the destruction of any such building or buildings, or for the preservation of the life or health of its citizens, it shall be the duty of the Commissioner of Buildings to ascertain the amount of such outlay or expenditure and present a bill therefor to the owner or owners of any such building or buildings, or his or their agent or agents, and it shall be the duty of the said Commissioner of Buildings to refuse to issue a permit for the reconstruction, alteration or repair of any such building or buildings by such owner or owners until such outlay or expenditure shall be repaid to the city by the owner or owners of such building or buildings so totally or partially destroyed in the manner aforesaid. Said Commissioner shall also proceed forthwith to collect from such owner or owners, by appropriate proceedings, the amount of such bill.

**Sec. 13. (May Make Rules for Construction of Buildings and Control of Employees.)**—The Commissioner of Buildings shall institute such measures and prescribe such rules and regulations for the control and guidance of his subordinate officers and employes as shall secure the careful inspection of all buildings while in process of construction, alteration, repair or removal and the strict enforcement of the several provisions of this chapter.

**Sec. 14. (May Stop Construction and Wrecking of Buildings.)**—Amended by ordinance Dec. 11, 1905, to read as follows:

*Said Commissioner shall have power to stop the construction of any building or the making of any alterations or repairs of any building within said city when the same is being done in a reckless or careless manner or in violation of any ordinance, and to order, in writing, or by parole, any and all persons in any way or manner whatever engaged in so constructing, altering or repairing any such building, to stop and desist therefrom.*

*And the said Commissioner shall have power to stop the wrecking or tearing down of any building or structure within said city when the same is being done in a reckless or careless manner or in violation of any ordinance or in such a manner as to endanger life or property, and to order any and all persons engaged in said work to stop and desist therefrom. When such work has been stopped by the order of said Commissioner, it shall not be resumed until said Commissioner shall be satisfied that adequate precautions will be taken for the pro-*

tection of life and property, and that said work will be prosecuted carefully and in conformity with the ordinances of the city.

The penalties prescribed by Section 1157 (Sec. 738, Code 1905), for violations, shall apply with equal force and effect to violations of this section.

**Sec. 15. (Arbitration Appeal from Decision.)**—In cases where discretionary power to estimate damage to frame buildings is given the Commissioner of Buildings, as also in questions relating to the security or insecurity of any building or buildings, or parts thereof, and in all other cases where discretionary powers are, by ordinance, given to the Commissioner of Buildings, an appeal to arbitration shall be allowed to parties believing themselves injured or wronged by the decisions of the Commissioner of Buildings, as follows, to wit:

**Sec. 16. (Appeal.—Limit of Time of.)**—Any person wishing to make such appeal shall do so within five days after written notice of the decision or order of the Commissioner of Buildings has been given him. An appeal made later than five days after the serving of the notice of the Commissioner of Buildings shall not entitle the appellant to an arbitration. The request for arbitration shall be in writing and shall state the object of the proposed arbitration and the name of the person who is to represent the appellant as arbitrator.

**Sec. 17. (Appeal.—Cost of.)**—The Commissioner of Buildings shall thereupon state to the appellant the cost of such arbitration, and such appellant shall, within twenty-four hours from the time of filing the original request for arbitration, deposit with the Commissioner of Buildings the sum of money required for defraying the expenses of the same, which sum shall in each case be fixed by said Commissioner in proportion to the difficulty and importance of the case, but shall in no case be more than the cost of similar service in the course of ordinary business of private individuals or corporations. As soon as such sum of money shall have been deposited with him the Commissioner of Buildings shall appoint an arbitrator to represent the city, and the two arbitrators thus appointed shall, if they cannot agree, select a third arbitrator, and the decision of any two of these arbitrators shall, after investigation of the matter in question, be final and binding on the appellant as well as upon the city.

**Sec. 18. (Arbitrators to Take Oath.—Power to Examine Witnesses.)**—The arbitrators shall themselves, before entering upon the discharge of their duties, be placed under oath to the effect that they are unprejudiced as to the matter in question and that they will faithfully discharge the duties of their position. They shall have the power to call witnesses and place them under oath, and their decision or award shall be rendered in writing both to the Commissioner of Buildings and to the appellant from his decision. The fee deposited by the appellant with the Commissioner of Buildings shall be paid by the Commissioner of Buildings to the arbitrators upon the rendering of their report, and shall be in full of all costs incident to the arbitration; but should the decision of said board of arbitration be rendered against the Commissioner of Buildings, then the money deposited by the aforesaid appellant shall be returned to him, and the entire cost of such arbitration shall be paid by the city.

**Sec. 19. (In Urgent Cases.—Commissioner's Power Final.)**—Whenever the decision of the Commissioner of Buildings upon the safety of any building or any part thereof is made in a case so urgent that failure to properly carry out his orders to demolish or strengthen such building or part thereof may endanger life and limb, the decision and order of the Commissioner of Buildings shall be absolute and final.

**Sec. 20. (Duty of Police to Assist Commissioner in Enforcing Provisions of This Chapter.)**—Whenever it shall be necessary, in the opinion of the Commissioner of Buildings, to call upon the Department of Police for aid or assistance in carrying out or enforcing any of the provisions of this chapter, he shall have the authority so to do, and it shall be the duty of the Department of Police, or of any member of said Department, when called upon by said Commissioner, to act according to the instructions of, and to perform such duties as may be required by, said Commissioner in order to enforce or put into effect the provisions of this chapter.

**Sec. 21. (Certificates.—Notices.)**—The Commissioner of Buildings shall sign or cause to be signed all certificates and notices required to be issued from said Department, and keep a record of the same, and issue or cause to be issued all permits authorized herein.

**Sec. 22. (Must Keep a Register.)**—He shall also keep in proper books for that purpose a register of all transactions of the Department of Buildings, which such books shall be open to the inspection of the Mayor, Comptroller, Superintendent of Police, Fire Marshal and members of the City Council at all times.

**Sec. 23. (Must Keep Account of Fees Paid.)**—Said Commissioner shall keep, in proper books for that purpose, an accurate account of all fees paid, giving the name of the person paying same, date of payment and amount of each such fee.

**Sec. 24. (Annual Reports and Estimates.)**—He shall also annually, on or before the first day of February, in each year, prepare and present to the City Council a report showing the receipts and expenditures and entire work of his Department during the previous fiscal year, and he shall at the same time send to the Comptroller a full and comprehensive statement of all matters pertaining to his Department, together with an estimate in detail of the appropriations required by the Department during the current fiscal year.

**Sec. 25. (Deputy Commissioner of Buildings.)**—There is hereby created the office of Deputy Commissioner of Buildings. He shall be appointed by the Commissioner of Buildings according to law. Whenever the Commissioner of Buildings shall make requisition upon the Civil Service Commission of the city for a person to fill the office of Deputy Commissioner of Buildings, he shall notify the Civil Service Commission that the person certified to fill said office should be a competent civil engineer, architect or builder.

**Sec. 26. (Duties.)**—Said Deputy Commissioner shall pass upon all questions relating to the strength and durability of buildings; shall examine and approve all plans before a building permit is issued for the construction of any building or structure; shall supervise and have charge of all books and records and the various Inspectors employed in the Department of Buildings; shall receive, examine and file all reports made by them, and shall, under the direction and supervision of the Commissioner of Buildings, assign to such Inspectors the work they are to perform. He shall have a book or books in which shall be recorded the location and character of every building for which a permit is issued, and a copy of every report of inspection made for such building, so arranged that the full history of the various inspections of the building shall appear therein in consecutive order, with the name of each Inspector making the inspection thereof and the date of his report. He shall cause to be kept a record of all complaints of violations of the building ordinances, shall report the same to the Commissioner of Buildings, and shall cause all such complaints to be investigated. He shall act as Commissioner of Buildings in the absence of the Commissioner of Buildings from his office, and while so acting shall discharge all the duties and possess all the powers invested in or imposed upon the Commissioner of Buildings.

**Sec. 27. (Bond.)** He shall before entering upon the duties of his office execute a bond to the city in the sum of ten thousand (\$10,000) dollars, with such sureties as the City Council shall approve, conditioned for the faithful performance of the duties of his office.

**Sec. 28. (Assistant Deputy Commissioner of Buildings.)**—There is hereby created the office of Assistant Deputy Commissioner of Buildings. He shall be appointed by the Commissioner of Buildings according to law. Whenever the Commissioner of Buildings shall make requisition upon the Civil Service Commission of the city for a person to fill the office of Assistant Deputy Commissioner of Buildings, he shall notify the Civil Service Commission that the person certified to fill said office should be a competent civil engineer, architect or builder.

The Assistant Deputy Commissioner of Buildings shall, under the direction of the Commissioner of Buildings or the Deputy Commissioner of Buildings, assist and aid the Deputy Commissioner in the performance of his duties.

**Sec. 29. (Bond.)**—The Assistant Deputy Commissioner of Buildings, before entering upon the duties of his office, shall execute a bond to the city in the sum of five thousand (\$5,000) dollars, with such sureties as the City Council shall approve, conditioned for the faithful performance of the duties of his office.

**Sec. 30. (Secretary.—Duties.)** The Commissioner of Buildings shall appoint a Secretary, according to law, whose duty it shall be to preserve and keep, under the supervision and direction of the Deputy Commissioner of Buildings, all books, records and papers belonging to said office or which are required by law to be filed therein. The Secretary shall deliver to the City Council and to the respective departments all communications from said Commissioner, in writing, and perform such services as may be required by said Commissioner or Deputy Commissioner of Buildings.

**Sec. 31. (Chief Building Inspector.)**—There is hereby created the office of Chief Building Inspector. He shall be appointed by the Commissioner of Buildings according to law. Whenever the Commissioner of Buildings shall make requisition upon the Civil Service Commission of the city for a person to fill the office of Chief Building Inspector he shall notify the Civil Service Commission that the person certified to fill said office should be a competent civil engineer, architect or builder.

The Chief Building Inspector shall, under the direction of the Commissioner of Buildings, inspect and examine special cases of violations of the provisions of this chap-

ter, damages to buildings by fire, the elements or accident of any kind whatsoever, and shall perform such other duties as may be required by the Commissioner of Buildings or the Deputy Commissioner of Buildings.

Sec. 32. (**Bond.**)—The Chief Building Inspector, before entering upon the duties of his office, shall execute a bond to the city in the sum of five thousand (\$5,000) dollars, with such sureties as the City Council shall approve, conditioned for the faithful performance of the duties of his office.

Sec. 33. (**Inspectors.—Not to Engage in Business.**)—The Inspectors of Buildings, after their appointment to office, shall not be engaged in any other business or vocation.

Sec. 34. (**Inspectors.—Duties.—Reports.—How Made.**)—The said Inspectors shall, under the direction of the Commissioner of Buildings, examine all buildings in the course of erection, alteration, repair or removal throughout the city at least once a week, or as often as may be required for securing efficient supervision, and shall make written reports to said Commissioner as to all violations of any ordinance of the city which the Department of Buildings is required to enforce, together with the street and number where such violations are found, the names of the owner, agent, lessee, or occupant thereof, and of architect, contractor and master mechanic, engaged in or about the construction of such building and all other matters relative thereto as far as they can ascertain them.

Sec. 35. (**Report.—Must File Daily.**)—Inspectors of Buildings shall file daily reports of their work of inspection, which shall be entered in the books to be kept for that purpose, and which shall be open to official inspection at all times.

Sec. 36. (**Inspection.—Record of.—How Made.**)—The said Inspectors shall examine all buildings and walls reported dangerous or damaged by fire or accident and make a record of such examinations, with the name of the street and number of the building and of the names of the owner, agent, lessee and occupant thereof.

Sec. 37. (**Alteration, Enlargement or Raising.—Inspection of.**)—The Inspectors of Buildings shall examine all buildings for which an application to raise, enlarge or alter has been made, and shall make a written report upon the condition of the same to the Commissioner of Buildings before the permit is granted.

Sec. 38. (**Duties.—Other.**)—Said Inspectors shall perform such other duties as may be required of them by said Commissioner of Buildings, the rules and regulations of the Department of Buildings, or the ordinances of the city.

Sec. 39. (**Powers.—Other.**)—The Commissioner and Deputy Commissioner of Buildings, as well as the Inspectors of Buildings and of Elevators, are empowered to enter any building, whether completed or in process of erection, for the purpose of determining whether the same has been or is being constructed in accordance with the terms of this chapter, and it shall not be lawful to exclude them from such buildings.

Sec. 40. (**Elevator Inspectors.—Not to Engage in Business.—Duties.**)—The Inspectors of Elevators shall not, after their appointment to office, be employed or engaged in any other business or vocation.

The Inspectors of Elevators shall perform such duties as may be required of them by the Commissioner of Buildings, the rules and regulations of the Department of buildings or the ordinances of the city.

## ARTICLE II.

### PERMITS, PLANS AND FEES.

Sec. 41. (**Permits.—When Required.—Limitations of Time For.**)—Amended by ordinance Feb. 26, 1966, to read as follows:

*Before proceeding with the erection, enlargement, alteration, repair or removal of any building in the city, a permit for such erection, enlargement, alteration, repair or removal shall first be obtained by the owner or his agent from the Commissioner of Buildings, and it shall be unlawful to proceed with the erection, enlargement, alteration, repair, or removal of any building or of any structural part thereof within the city unless such permit shall first have been obtained from the Commissioner of Buildings. And, if after such permit shall have been granted, the operations called for by the said permit shall not be begun within six months after the date thereof, or if such operations are not completed within a reasonable time, then such permit shall be void, and no operations thereunder shall be begun or completed until a new permit shall be taken out by the owner or his agent, and fees as herein fixed for the original permit shall be paid for such new permit.*

32-222, 33-223, 34-35-224, 36-225, 37-38-226, 39-41-227-229

**Sec. 42. (Approval of Architects' Plans.)**—Amended by ordinance Feb. 26, 1906, to read as follows:

*In all cases where a licensed architect shall have completed, signed and affixed his seal to plans, drawings or specifications for any building designed to be erected within the corporate limits of the city, or any structural part thereof, for which a building permit must be procured before the same may be erected, the architect making such plans, drawings, or specifications, shall submit same to the Commissioner of Buildings for examination and approval; and, if the same shall comply with the provisions of this chapter the said Commissioner shall stamp such plans, drawings or specifications in such a manner as to indicate that same have been examined and approved, and the date of such approval, and such stamp shall be preliminary to the final stamp hereinafter provided for.*

*Said preliminary stamp shall be so affixed before any contract or contracts shall be entered into on behalf of said owner in regard to the construction of said building or buildings on the part of said architect or other person or persons.*

**Sec. 43. (Permits—Application For—How Made—How Recorded—Stamped Plans—How Cared For—Return of Same.)**—Amended by ordinance Feb. 26, 1906, to read as follows:

*Application for such permits shall be made by the owner or his agent to the Commissioner of Buildings. When such application is made, plans and specifications in conformity with the provisions of this chapter, which have been examined and approved by said Commissioner as hereinbefore provided for, shall be filed with the Commissioner of Buildings, who shall then issue a permit and shall file such application, and shall apply to such plans and specifications a final official stamp, stating that the drawings and specifications to which the same have been applied comply with the terms of this chapter. The plans and specifications so stamped shall then be returned to such applicant. True copies of so much of such plans and specifications as may be required in the opinion of the Commissioner of Buildings to illustrate the features of construction and equipment of the building referred to, shall be filed with the Commissioner of Buildings and shall remain on file in his office until the completion or occupation of such building, after which such drawings and specifications shall be returned by the Commissioner of Buildings to the person by whom they have been deposited with him upon demand. It shall not be obligatory upon the Commissioner of Buildings to retain such drawings in his custody for more than three months after the completion or occupation of the building to which they relate.*

**Sec. 44. (Plans.—Essentials Of.)**—All such plans and drawings shall be drawn to a scale of not less than one-eighth of an inch to the foot, on paper or cloth, in ink, or by some process that will not fade or obliterate. All distances and dimensions shall be accurately figured, and drawings made explicit and complete, showing the entire sewerage and drain pipes and location of all plumbing fixtures within such building. Each set of plans presented shall be accompanied by a set of specifications describing all materials to be used in the proposed building, and both the plans and specifications shall be approved by the Commissioner of Buildings before a permit will be granted. No permit shall be granted or plans approved unless such plans shall be signed and sealed by a licensed architect, as provided in "An act to provide for the licensing of architects and regulating the practice of architecture as a profession in the State of Illinois," approved June 3, 1897. Provided, that permits may be granted for the erection of buildings of Class III., as hereinafter defined, if such building shall not be more than two stories in height and shall have a superficial area of not more than 1,250 square feet outside dimensions, on plans approved by the Commissioner of Buildings, which plans need not be signed by a licensed architect.

**Sec. 45. (Plans.—Alterations Upon Stamped Plans Not Permitted Without Permission.—Certain Alterations Excepted.)**—It shall be unlawful to erase, alter or modify any lines, figures or coloring contained upon such drawings or specifications so stamped by the Commissioner of Buildings or filed with him for reference. If, during the progress of the execution of such work, it is desired to deviate in any manner affecting the construction or other essentials of the building from the terms of the application, drawing or specification, notice of such intention to alter or deviate shall be given to the Commissioner of Buildings, and his written assent shall first be obtained before such alteration or deviation may be made. Alterations in buildings which do not involve any change in their structural parts or of their stairways, elevators, fire escapes or other means of communication or ingress or egress and that are not in violation of any of the provisions of this ordinance may be made without the permission of the Commissioner of Buildings.

**Sec. 46. (Deposit With Water Department.—How Made.—Indemnifying Bond.)**—Before the Commissioner of Buildings issues a permit as aforesaid he shall require evidence from the applicant that payment has been made to the Bureau of Water of the city for the water to be used or for a watermeter for measuring all the water

to be used in the construction of such building, under the regulations of the Bureau of Water. Such applicant shall produce evidence that he has filed with and had approved by the Commissioner of Public Works of the City an indemnifying bond protecting the city against any and all damage that may arise to the streets or alleys upon which such building abuts, and to the city and to any person in consequence or by reason of the proposed operations to be authorized by such permit, or by reason of any obstruction or occupation of any street or sidewalk in and about such building operations.

**Sec. 47. (Fees for Water Used.)**—The fees to be paid for water used in connection with the erection of buildings shall be as follows, to wit:

For water to be used in connection therewith at the rate of five cents for every one thousand bricks, wall measure, used in the construction of a building.

At the rate of six cents for every one hundred cubic feet of rubble stone used in connection therewith.

At the rate of eight cents for every one hundred cubic feet of concrete used in connection therewith.

At the rate of fifteen cents for every one hundred yards of plastering used in connection therewith; and

At the rate of five cents for every one hundred cubic feet of hollow tile arch, partition or fireproof covering used in any building.

**Sec. 48. (Permits.—Cost of.)**—The fees to be charged for building permits shall be as follows: For sheds not exceeding three hundred square feet in area, two dollars; for open shelter sheds, at the rate of fifty cents for each one thousand cubic feet or part thereof; but in no case shall a permit be issued for a less fee than two dollars.

For all buildings other than sheds and open shelter sheds, as hereinbefore described, the fee for the permit shall be at the rate of ten cents for every one thousand cubic feet or fractional part thereof contained therein, the cubic contents being measured to include every part of the building from the basement floor to the highest point of the roof and to include all bay-windows and other projections; but in no case shall any permit be issued for a less fee than two dollars.

**Sec. 49. (Permit for Alterations and Repairs.—Cost Of.)**—The fee to be charged for permits issued for alterations and repairs in or to any building or structure shall be as follows:

Where such alteration or repair shall equal fifty per cent. or more of the original building or structure to be altered or repaired, or of such part or portion of such building or structure to be altered or repaired, the same fees shall be charged as if such permit were for the construction of a new building.

Where such work of alteration or repair shall be less than fifty per cent. of the original building or structure or of the part or portion to be altered or repaired, the fee to be charged for a permit for such work shall be half that charged for the issuance of a permit for new work.

**Sec. 50.** Amended by ordinance March 30, 1906, to read as follows:

*The fee for a permit to raise a wooden building or to re-shingle a roof shall be one dollar.*

**Sec. 50a. (Permit for Wrecking Building.)**—Added by ordinance Dec. 11, 1905:

*Before proceeding with the wrecking or tearing down of any building or structure a permit for such wrecking or tearing down shall first be obtained by the owner or his agent from the Commissioner of Buildings, and it shall be unlawful to proceed with the wrecking or tearing down of any building or structure or any structural part thereof within the city unless such permit shall first have been obtained. Application for such permit shall be made by such owner or his agent to the Commissioner of Buildings, who shall issue such permit upon such application and the payment of the fee herein provided for. Such application shall state the location and describe the building which it is proposed to wreck or tear down. The fee for such permit shall be two dollars for every twenty-five feet or fractional part thereof, of frontage. Upon the issuance of such permit such building may be wrecked or torn down, provided that all the work done thereunder shall be subject to the supervision of the Commissioner of Buildings, and shall be performed under the same restrictions as govern the erection of buildings. The penalties prescribed by Section 1157 (Sec. 738, Code 1905), for violations, shall apply with equal force and effect to violations of this section.*

**Sec. 51. (Permits for Raising or Moving Buildings Other Than Frame.)**—The fee for a permit to raise or move a building other than a frame building shall be two (\$2) dollars for every twenty-five (25) feet, or fractional part thereof, of frontage, and when such building is to be moved from one location to another it shall be altered

47—234, 48—235-6, 49—237, 50—, 51—238

or reconstructed so as to conform to the ordinances governing the construction of such building at the time of moving the same.

**Sec. 52. (Permit.—Revocation Of.)**—If work in, upon or about any building shall be conducted in violation of any of the provisions of this chapter, it shall be the duty of the Commissioner of Buildings to revoke the permit for the building operation in connection with which such violation shall have taken place. It shall be unlawful, after the revocation of such permit, to proceed with such building operations unless such permit shall first have been reinstated or reissued by the Commissioner of Buildings. Before a permit so revoked may be lawfully reissued or reinstated the entire building and building site shall first be put into condition corresponding with the requirements of this chapter, and any work or material applied to the same in violation of any of the provisions of this chapter shall be first removed from such building.

## ARTICLE III.

### CLASSIFICATION OF BUILDINGS.

**Sec. 53. (Buildings.—Classes Of.)**—All buildings (other than sheds and shelter sheds, as hereinafter described) now existing or hereafter constructed, altered or enlarged within the city, shall be classified as follows:

**Sec. 54. (Class I.)**—In Class I. shall be included every building used for the sale, storage or manufacture of merchandise, other than department stores, as described in Sections 60 and 70 of this chapter, and all stables covering or occupying a ground area of over five hundred square feet.

**Sec. 55. (Class II.)**—In Class II. shall be included every office building, hospital and every building used for hotel purposes or for boarding or lodging house purposes where such building so used for hotel or boarding or lodging house purposes is occupied by twenty or more persons.

**Sec. 56. (Class III.)**—In Class III. shall be included every building used as a family residence, also every building used for stabling purposes where such building so used shall occupy a ground area of less than five hundred square feet.

**Sec. 57. (Class IV.)**—In Class IV. shall be included every building used as an assembly hall, whether such hall is used for the purpose of worship, instruction or entertainment, unless such building is used for any of the purposes for which buildings of Class V. or Class VIII. are used.

**Sec. 58. (Class V.)**—In Class V. shall be included every building which is used as a public theater where an admission fee is charged and in which movable scenery is used; provided, however, that public halls and club halls with a seating capacity of less than six hundred, although occasionally used for theatrical representations, shall not be construed to be public theaters within the meaning of the term as used in this section, notwithstanding the fact that movable scenery is used upon the stage thereof on such occasions, and such public halls and club halls shall not be considered as buildings of Class V. as herein defined. Such public halls and club halls shall be included in Class IV., as defined in Sections 57 and 400 of this chapter.

**Sec. 59. (Class VI.)**—In Class VI. shall be included every tenement and apartment house; that is to say, any house or building or portion thereof which is used as a home or residence for two or more families living in separate apartments.

**Sec. 60. (Class VII.)**—In Class VII. shall be included all buildings used for the sale at retail of dry goods and other articles of general merchandise and commonly known and described as "department stores."

**Sec. 61. (Class VIII.)**—In Class VIII. shall be included every building used exclusively for school purposes.

**Sec. 62. (Buildings Used for the Purposes of More Than One Class.)**—Where any building is used for the purposes of two or more classes as herein specified and defined, such portion of any such building as is devoted to the uses and purposes of any particular class shall be constructed, operated and maintained in accordance with the requirements of this ordinance relating to such class, unless such construction shall prove impracticable or unless there would be a conflict between the provisions of this ordinance relating to the construction of buildings; in either of which cases the provisions relating to and governing the construction of buildings of the class requiring the best and safest form of construction shall govern.

**Sec. 63. (Conflict Between Special and General Provisions.)**—Whenever any provision or requirement of this chapter relating specifically to the construction, equipment, maintenance or operation of any building or part of a building used for the

purposes of any specified class shall conflict with the general provisions of this chapter relating to the construction, operation and equipment of buildings generally, the special provisions shall govern in each case, except in the case of section —, which shall govern in all cases coming within its provisions.

## ARTICLE IV.

### PROVISIONS RELATING SOLELY TO CLASS I.

Sec. 100. (Class I.)—In Class I. shall be included every building used for the sale, storage or manufacture of merchandise other than department stores, as described in Sections 60 and 700, and all stables covering or occupying a ground area of over five hundred square feet.

Sec. 101. (Walls of Class I.—Thickness Of.)—The thickness of surrounding walls and of all dividing walls in every building used wholly or in part for the purposes of Class I. shall be made as indicated in the following table, to wit:

	Basement.	STORIES										
	1	2	3	4	5	6	7	8	9	10	11	12
One-story .....	12	12										
Two-story .....	16	12	12									
Three-story .....	16	16	12	12								
Four-story .....	20	20	16	16	12							
Five-story .....	24	20	20	16	16	16						
Six-story .....	24	20	20	20	16	16	16					
Seven-story .....	24	20	20	20	20	16	16	16				
Eight-story .....	24	24	24	20	20	20	16	16	16			
Nine-story .....	28	24	24	24	20	20	16	16	16	16		
Ten-story .....	28	28	28	24	24	24	20	20	20	16	16	
Eleven-story .....	28	28	28	24	24	24	20	20	20	16	16	16
Twelve-story .....	32	28	28	28	24	24	24	20	20	20	16	16

Provided, however, in buildings of steel skeleton fireproof construction thickness of walls shall be governed by Section 911.

Sec. 102. (Buildings.—Height and Construction Of.)—Buildings of Class I. which are one hundred feet or more in height shall be built entirely of fireproof construction.

Buildings of Class I. less than one hundred feet and more than sixty feet in height shall be built entirely of slow-burning, mill or fireproof construction.

No building of Class I. more than five stories in height shall be permitted to be built of ordinary construction.

Sec. 103. (Walls.—Exception to Table of Thickness Of.)—If buildings of Class I. are erected of less depth than 100 feet from front to rear or between cross walls, or if the walls supporting their floors and roofs are less than twenty-five feet apart, the thickness of the walls given in the aforesaid table may be reduced by four inches, excepting only that no wall in such buildings shall be less than twelve inches thick.

Sec. 104. (Walls.—Metal, Lath and Solid Cement Plaster Covering.)—A one or two-story building used for the purposes of Class I., no part of which is within twenty feet of any lot line, alley line or street line, having a complete self-supporting steel frame consisting of wall columns supporting steel trusses, with steel trusses and steel diagonals designed to resist safely within the safe limits of stress provided by this chapter a wind pressure of thirty pounds per square foot for each and every exterior surface exposed to the wind, in addition to the dead weight of the completed structure and in addition to the live load of one hundred pounds per square foot provided for by this chapter and any other live loads which may be imposed on said structure, may have exterior walls measuring not less than one and one-third inches thick of metal, lath or metal fabric plastered on both sides with a mortar consisting only of Portland cement and torpedo sand. A complete reinforced concrete framework built in every manner equally as strong and as safe as provided for a steel frame in this section may have exterior walls built in the same manner of the same materials and of the same thickness.

Sec. 105. (Door Openings at Street Level.—Class I.)—The aggregate width of door openings at the street level in buildings of Class I. shall be equal to the aggregate width of stairways, as specified in Section 115 of this chapter, and such doors shall not be locked during business hours or while such buildings are occupied by a number of persons for any purpose. Revolving doors shall not be considered as complying with this section, unless the revolving wings of said revolving doors are so arranged that by the application of a force slightly more than necessary to revolve said doors and which one person of ordinary strength is capable of exerting, all the wings of said doors fold flat on

*each other and in an outward direction, and unless each side, or the half circles of such revolving doors, are hinged and fastened so as to likewise swing backwards on application of force slightly beyond the normal, and which will permit of exit space for two ordinary persons on either side of the collapsed wings of said revolving doors and their inclosing half circles.*

As amended by ordinance March 30, 1906, by addition of the part in italics.

**Sec. 106. (Buildings of Class I.—Increasing Height Of.)**—In all cases where buildings of Class I., of ordinary construction, already built, are to be increased in height above the height of sixty feet or above the height of one hundred feet, the additional parts of such buildings shall be constructed as herein provided for buildings over sixty feet high or over one hundred feet high, respectively, and shall be made to conform in all respects and throughout their entire extent to the requirements for buildings of this class more than sixty feet or more than one hundred feet high, respectively, before it shall be lawful to occupy them.

**Sec. 107. (Ceilings and Roof of Class I.—Space Between.)**—In buildings of Class I., if the inclosed space between the ceiling and the roof is of greater average height than two feet, easy and convenient means of access, satisfactory to the fire marshal, shall be given to such space.

**Sec. 108. (Fire Walls.—In Buildings of Class I.)**—Buildings occupied by more than one person or corporation, or for more than one business enterprise conducted by the same person or corporation, in separate inclosures on any one floor, shall have a brick dividing wall for every fifty (50) feet of street frontage if of ordinary construction, or for every eighty (80) feet of street frontage if of slow-burning or mill construction, and such dividing walls shall extend from the front to the rear wall, and such dividing walls, and the doors therein shall be built as dividing walls, and the doors therein are required to be built by the provisions of this chapter.

All of the partitions between the parts of such buildings, occupied by different persons or corporations shall be built of incombustible material from the floor to the floor boards or roof boards next above such story or stories so occupied.

Only metal framed windows glazed with one-quarter inch thick fire-resisting glass may be used in such partitions.

**Sec. 109. (Dividing Walls.—When Required in Class I.)**—Dividing walls will be required in buildings of Class I. as follows: For buildings of ordinary construction if their floor area exceeds nine thousand square feet; for buildings of slow-burning or mill construction more than one story in height if their area exceeds twelve thousand square feet; for fireproof buildings more than two stories in height, if their area exceeds twenty-five thousand square feet. In each of the before mentioned cases such buildings shall be subdivided by brick walls built of the thickness given in the table for the thickness of inclosing walls, and all doors and other openings in such walls shall have iron doors or shutters at each side of same. The buildings so subdivided shall be treated as regards stairs and fire escapes the same as two or more separate buildings, provided, however, one-story buildings of ordinary, mill or slow-burning construction or two-story buildings of fireproof construction of any size, used as one store, room or workshop and occupied by only one person or corporation, may be erected without any dividing walls.

**Sec. 110. (Dividing Walls and Iron Doors.—Openings Inserted In.)**—If openings are to be inserted in dividing walls, as before described, or in dividing walls between non-fireproof and fireproof buildings or parts of either of such buildings, they shall be made as follows:

They shall have doors placed on each side of each opening in such walls, which doors shall be made of No. 12 plate iron with a continuous 2 by 2 by one-half-inch angle iron frame extending all around the same and the plate riveted thereto with one-half-inch rivets, placed four inches between centers. If such doors are made double they shall have cross bars, levers and hooks so arranged that when the doors are closed they will be of strength equal to that of a single door. All doors shall be hung on frames made of three-quarter by 4-inch iron stiffened with an angle iron extending all around the same and fitting up snug to the wall. The frames shall be fastened to each other by bolts extending through the wall, such bolts being not more than two feet apart, and such doors shall swing on three hinges and shall be made to fit closely to the frame all around. The sills between the doors shall be of brick, iron, stone or concrete and shall rise at least two inches above the floor on each side of each opening. The lintel over the door shall be made of brick or iron, and the wall between the two door frames shall be covered with a coat of plaster at least one-half inch thick.

**Sec. 111. (Elevator Buildings.—Bins Of.)**—Elevator buildings (which term shall be interpreted as including all buildings intended solely for the receipt, storage and

delivery of grain in bulk) may be constructed with the bin walls, both externally and internally, made entirely of wood; provided such walls are made solid and without cellular open spaces within them. The external bin walls shall have a covering of brick or hollow tile not less than twelve inches thick, which shall be united to the bin walls by anchors, in the construction and arrangement of which due allowance is made for the variations of shrinkage of the inclosing wall and of the wooden bin wall. If the weight of the bins is independently carried on a skeleton construction of timber, steel or iron, the first-story walls shall be of brick not less than twenty inches thick. If the outer walls of the outside bins and their facing are not carried on a skeleton construction, then the first-story wall shall not be less than twenty-eight inches thick, or as much thicker as may be required to keep the load upon the brickwork within the limits of stress elsewhere specified in this chapter. Elevator buildings may be built of reinforced concrete and they shall be built according to the provisions of Section 969 of this chapter.

**Sec. 112. (Cupola.—Inclosure Walls Of.—Openings.)**—The inclosing walls of cupolas on elevator buildings, if constructed of wood, shall be covered with corrugated iron or other incombustible material.

The outside openings in elevator buildings shall have protection of wire netting made of No. 14 wire, with meshes not over one-half by one-half inch.

All openings in the body of the first story of elevator buildings and the openings in the engine and boiler houses of the same and between these and the main building shall have iron doors made in accordance with the provisions of Section 110 of this chapter.

**Section 113. (Ventilating Ducts.—Chutes.—Walls Surrounding.)**—Wall surrounding ventilating ducts and rubbish and ash chutes shall be constructed in accordance with the regulations governing the construction of smoke flues elsewhere herein contained. Walls around ventilating ducts shall not be less than four inches thick, and when the ventilating duct is larger than 260 square inches the walls shall be not less than eight inches thick.

**Sec. 114. (Store Fronts.—Columns and Lintels Supporting.)**—The columns and lintels supporting store fronts in buildings within the fire limits of more than one story in height shall be made of incombustible material.

**Sec. 115. (Stairs in Buildings of Class I.—Number and Width Of.)**—There shall be in all buildings of Class I. of ordinary construction and of less floor area than one thousand square feet and not more than two stories in height, a stairway not less than three feet in width, and in all buildings of ordinary construction of more than one thousand square feet of floor area and less than three thousand square feet of floor area, two flights of stairs not less than three feet wide each. For buildings of ordinary construction of Class I. and of greater floor area than three thousand square feet, there shall be six inches added to the width of each such flight of stairs for each additional one thousand square feet of floor area, or fractional part thereof, up to nine thousand square feet of floor area.

For buildings of slow-burning or mill construction with a floor area of less than twelve hundred square feet and not more than two stories in height, there shall be a stairway not less than three feet in width; buildings of a greater floor area than twelve hundred square feet and less than four thousand square feet shall have two flights of stairs, not less than three feet wide each, and there shall be six inches added to the width of each such flight of stairs for each additional one thousand square feet of floor area, or fractional part thereof, up to twelve thousand square feet. Provided, however, that additional flights of stairs may be used to make the aggregate width required, instead of widening the two flights above mentioned. It is further provided, however, that such stairs may be reduced one foot in width for each four stories in height, or fractional part thereof, above the fourth story of such building, but such stairs shall in no case be of less width than three feet.

For fireproof buildings there shall be required one flight of stairs not less than four feet wide for the first 3,000 square feet of floor area, or fractional part thereof. For buildings of more than 3,000 square feet and not exceeding 5,000 square feet of floor area, there shall be required one flight of stairs not less than five feet in width. For more than 5,000 square feet and less than 10,000 square feet of floor area there shall be an additional flight of stairs not less than three feet in width. For more than 10,000 square feet and less than 15,000 square feet of floor area, each of such stairs shall be of not less width than five feet. For more than 15,000 square feet and less than 25,000 square feet of floor area, there shall be not less than three stairways of an aggregate width of fifteen feet; none of such stairs shall be of less width than three feet.

The width of the different stairways need not be alike. The width of each stairway in the fifth, sixth, seventh and eighth stories may be six (6) inches less in the clear than the width of the stairways in the first to the fourth stories, inclusive.

The width of each stairway in the ninth, tenth, eleventh and twelfth stories may be twelve (12) inches less in the clear than the width of the stairways in the first to the fourth stories, inclusive.

The width of each stairway in the thirteenth, fourteenth, fifteenth and sixteenth stories may be eighteen (18) inches less in the clear than the width of the stairways in the first to the fourth stories, inclusive, and this reduction in width may be continued in the same ratio in each additional four (4) stories added to the height of the building; provided, however, that no stairway shall have a less clear width than three (3) feet.

All stairways in buildings of Class I, shall have a hand rail on each side thereof, and where there is more than one stairway in any building of Class I, such stairways shall be located at each end of the building, or as far apart from each other as is practicable.

**Doors and Windows.**—When required to be closed, fire-resisting glass. See Section 1049.

**Limitations in Changing Class of Buildings.**—See Section 1050.

**Buildings Used for the Purposes of More Than One Class.**—See Section 62.

**\*Courts, light shafts, well holes, etc.,** to be built in accordance with Section 707.

**Sec. 116. (Loads.—Allowance for Live Loads in Construction of Floors of Class I.)**—The floors of all buildings of Class I shall be designed and constructed in such a manner as to be capable of bearing in all their parts, in addition to the weight of floor construction of partitions and permanent fixtures and mechanisms that may be set upon the same, a live load of one hundred pounds for every square foot of surface in such floor; and the strength of such building shall be increased above the capacity to carry such a live load of (1) hundred pounds per square foot of floor surface when the uses to which such building or part thereof is to be applied involve greater stress.

**Sec. 117. (Floors.—Display of Placard Indicating Strength Of.)**—It shall be the duty of the owner of every building of Class I, already constructed, or hereafter to be constructed, or of his agent, or of the occupant or person in possession, charge or control of the same, to affix and display conspicuously on each floor of such building a placard stating the load per square foot of floor surface which may with safety be applied to that particular floor, or if the strength of different parts of any floor varies, then there shall be such placards for each varying part of such floor. It shall be unlawful to load any such floors, or any part thereof, to a greater extent than the load indicated upon such placards. It shall be the duty of occupants of buildings to maintain such placards during their occupation of the premises, and the owners of buildings, or their agents, to cause the same to be properly affixed with each change of occupation. It shall be part of the duty of architects of all buildings to calculate the figures for such placards, which are to be verified and approved by the Commissioner of Buildings before they are affixed upon the respective floors of the different buildings.

**Walls.—Ledges.**—See Section 997.

**Walls.**—Around Stairs, Elevators and Shafts. See Section 998.

**Walls.**—Reinforced concrete. See Section 960.

**Towers.—Domes.—Spires.**—See Section 1026.

## ARTICLE V.

### PROVISIONS RELATING SOLELY TO CLASS II.

**Sec. 200. (Class II.)**—In Class II, shall be included every office building, every hospital and every building used for hotel purposes, or for boarding or lodging house purposes, where such building so used for hotel, hospital or boarding or lodging house purposes is occupied by twenty or more persons.

**Sec. 201. (Walls of Class II.)**—The thickness of the walls of buildings of Class II, shall conform to the following requirements:

\*266, 116 to 117—267-268, 200—, 201—269

The thickness of the enclosing walls of buildings of this class shall be made in accordance with the following table, to-wit:

	STORIES											
	Basement.	1	2	3	4	5	6	7	8	9	10	11 12
Basement and .....	12	8										
Two-story .....	12	12	8									
Three-story .....	16	12	12	12								
Four-story .....	20	16	16	12	12							
Five-story .....	20	16	16	16	12	12						
Six-story .....	20	20	16	16	16	12	12					
Seven-story .....	24	24	20	20	16	16	12	12				
Eight-story .....	24	24	24	20	20	16	16	12	12			
Nine-story .....	28	24	24	20	20	20	16	16	12	12		
Ten-story .....	28	24	24	24	20	20	20	16	16	12	12	
Eleven-story .....	28	28	24	24	24	20	20	20	16	16	12	12
Twelve-story .....	32	28	28	24	24	24	20	20	20	16	16	12 12

Provided, however, in buildings of steel skeleton fireproof construction, thickness of walls shall be governed by the provisions of Section 911 of this chapter.

**Sec. 202. (Buildings.—Construction Of.—Height Of.)—**Buildings of Class II, which are one hundred feet or more in height shall be built entirely of fireproof construction.

Buildings of Class II, less than one hundred feet and more than sixty feet in height shall be built entirely of slow-burning, or mill or fireproof construction. Buildings of Class II, not exceeding four stories in height and less than sixty feet in height may be built of ordinary construction.

**Sec. 203. (Walls.—Division and Partitions in Boarding or Lodging Houses and Hotels.)—**In buildings used wholly or in part for boarding houses, lodging houses or hotels, sixty feet or less in height, there shall be for every eight rooms in any one story dividing walls or partitions of incombustible material, separating such eight rooms from the contiguous spaces. Partitions surrounding stairs and corridors shall be made of fireproof material.

**Sec. 204. (Stairs in Buildings of Class II.)—**Stairs in Buildings of Class II, shall be adapted, in number and width, to the area, height and to the uses to be made of the building in which they occur.

For office buildings, by which shall be understood buildings divided into apartments intended for business uses only, and in which there shall be no sleeping apartments whatever, there shall be in buildings of ordinary construction and of less ground area than three thousand square feet, two flights of stairs not less than three feet wide each; and for office buildings of ordinary construction and of greater floor area than three thousand square feet, there shall be six inches added to the width of each such flight of stairs for each additional one thousand feet of floor area, or fractional part thereof, up to six thousand square feet of floor area; for office buildings of ordinary construction and of greater floor area than six thousand square feet, there shall be an additional flight of stairs not less than three feet wide for each additional three thousand square feet of floor area, or fractional part thereof.

For office buildings of slow-burning or mill construction there shall be at least two flights of stairs three feet wide each for the first four thousand square feet of floor area, and there shall be six inches added to the width of each such flight of stairs for each additional one thousand square feet of floor area, or fractional part thereof, up to eight thousand square feet of floor area; and an additional flight of stairs not less than three feet wide shall be required for each additional four thousand square feet of floor area, or fractional part thereof, above eight thousand square feet.

For fireproof office buildings there shall be required one flight of stairs not less than four feet in width for the first three thousand square feet of floor area, or fractional part thereof.

For fireproof office buildings of more than three thousand, and not exceeding five thousand square feet of floor area, there shall be required one flight of stairs not less than five feet in width.

For more than five thousand and less than ten thousand square feet of floor area there shall be required an additional flight of stairs not less than three (3) feet in width.

For more than ten thousand and less than twenty thousand square feet of floor area there shall be required two flights of stairs of not less width than five (5) feet each; provided, that for each and every fireproof building of more than ten thousand square feet floor area there shall be at least two stairway fire escapes, placed as

far apart as practicable, on such buildings, in addition to the standpipe and platform fire escape required by this chapter and the statutes of this state.

An additional flight of stairs shall be required for each additional ten thousand square feet of floor area; provided, that for each additional five thousand square feet of floor area such stairway shall be not less than three feet wide.

And for additional floor areas between five thousand and ten thousand square feet such stairway shall not be less than five feet in width. The width of the different stairways need not be the same.

**\*(Hospitals, Hotels, Boarding or Lodging Houses.—Stairways.)**—For all buildings of Class II. of ordinary construction used as hotels, boarding or lodging houses, or hospitals, there shall be required for each building at least two flights of stairs, which, for buildings of three thousand square feet or less in floor area, shall be of not less width than three feet each, with an increase of six inches in width for each additional one thousand square feet of floor area, or fractional part thereof, up to a floor area of six thousand square feet; and after that there shall be an additional flight of stairs not less than three feet wide for each additional three thousand feet of floor area, or fractional part thereof.

For all buildings of Class II. slow-burning or mill construction used as hospitals, hotels, boarding or lodging houses, there shall be required for each building at least two flights of stairs, which, for buildings of four thousand square feet or less in floor area, shall be of not less width than three feet each, with an increase of six inches in width for each additional one thousand square feet of floor area, or fractional part thereof, up to a floor area of six thousand square feet; and after that there shall be an additional flight of stairs not less than three feet wide for each additional three thousand feet of floor area, or fractional part thereof.

For all buildings of Class II. of fireproof construction used as hospitals, hotels, boarding or lodging houses, there shall be required for each building at least two flights of stairs, which, for buildings of five thousand square feet or less in floor area, shall be of not less width than three feet each, with an increase of five inches in width for each additional one thousand square feet of floor area up to a floor area of ten thousand square feet, and there shall be required an additional flight of stairs not less than three feet wide for each additional four thousand square feet of floor area, or fractional part thereof.

Each stairway in the fifth, sixth, seventh and eighth stories may be built six (6) inches less in width in the clear than the stairways in the first to the fourth stories, inclusive.

Each stairway in the ninth, tenth, eleventh and twelfth stories may be built twelve (12) inches less in width in the clear than the stairways in the first to the fourth stories, inclusive.

Each stairway in the thirteenth, fourteenth, fifteenth and sixteenth stories may be built eighteen (18) inches less in width in the clear than the stairways in the first to the fourth stories inclusive, and this reduction in width may be continued in the same ratio in each additional four (4) stories added to the height of the building; provided, however, that no stairways shall have a less clear width than three (3) feet.

All stairways in buildings of Class II. shall have a hand rail on each side thereof, and where there is more than one flight of stairs in any building of Class II., such stairways shall be located at each end of the building, or as far apart from each other as is practicable.

**\*Sec. 205. (Fire Stops.)**—In hotels, hospitals, lodging houses or boarding houses, of other than fireproof construction, there shall be a fire stop of brick, concrete or tile, between the ceiling and floor in each floor of joists for each twenty-five feet, or fractional part thereof, measured in the direction of the length of the joists.

**Sec. 206. (Air.—Means of Communication with Outer Air in Buildings of Class II.)**—In all buildings of this class the courts, windows, light shafts, alcoves and vents shall be of the same size and dimensions as are prescribed in Sections 615, 623, 625, 627, 635, 636, 638 to 645, 646, 648 of this chapter relating to buildings of Class VI.

**Sec. 207. (Joists.—Supports For.)**—If in buildings of Class II. the distance between the enclosing walls is more than twenty-four feet in the clear, there shall be intermediate supports for the joists, which supports shall be either brick walls or iron or steel columns and beams or trusses or girders. If brick walls are used for this purpose, they may, in all cases where the thickness of walls is given in the table as sixteen inches or more, be made four inches less in thickness than the dimensions stated in the table.

**Sec. 208. (Loads.—Allowance for Live Loads in Construction of Floors of Class II.)**—For all buildings of Class II. the floors shall be designed and constructed in such manner as to be capable of bearing in all their parts, in addition to the weight of

the floor construction, partitions and permanent fixtures and mechanism that may be set upon the same, a live load of fifty pounds for every square foot of surface in such floors.

**Sec. 209. (Stalls or Rooms of Class II.—When Considered Habitable.)**—In buildings of Class II. no room shall be considered habitable or used as a habitation unless it has at least one window of an area equal to one-tenth of the superficial area of such room, opening into the external air. Provided, however, that no stall or compartment used as a sleeping room in a building, the walls of which stall or compartment do not extend within a distance of two and one-half feet from the ceiling thereof, shall be regarded and considered to be a room within the intent and meaning of the provisions hereof, but the walls of every such stall or compartment shall be of incombustible material.

**Sec. 210. (Hospitals.—Construction.—Height Of.—Permits.—Special Consents.)**—It shall be unlawful for any person or corporation to build, construct, maintain, conduct or manage in any block, if two-thirds of the buildings fronting upon both sides of the streets bounding such block or square are devoted chiefly to residence purposes, any hospital for the care, treatment or nursing of three or more insane persons; or any hospital for the care, treatment or nursing of three or more inebriates, or persons suffering from the effect of the excessive use of alcoholic liquors; or any hospital for the care, treatment or nursing of three or more epileptics; or any hospital for the care, treatment or nursing of three or more persons addicted to, or suffering from, the excessive use of morphine, cocaine or other similar drugs or narcotics; or any hospital for the care, treatment or nursing of any person affected with any infectious or contagious disease, unless the owners of a majority of the frontage in such block or square, and in addition thereto the owners of a majority of the frontage on the opposite sides of the streets bounding such block or square, consent in writing to the building, constructing, maintaining, managing or conducting of any such hospital in such block or square. Such written consents of the majorities of such property owners shall be filed with the Commissioner of Buildings, and an exact copy of the same shall be filed with the Commissioner of Health before a permit shall be granted for the building or constructing, or a license issued for the maintaining, conducting or managing of any such hospital. Provided, that any building that may be used for hospital purposes which is over two stories in height shall be of fireproof construction throughout, and no hospital shall be built to exceed six stories in height.

**Sec. 211. (Hospitals.—Location of Near School Houses.)**—No hospital of any kind or description hereafter erected or established within four hundred feet of property used for school purposes.

**(Walls.—Ledges.—Joist Supports.)**—All ledges in walls shall be as specified in Section 997 of this ordinance.

**Walls.**—Reinforced concrete. See Section 960.

**\*(Roofs.—Strength Of.)**—The roofs of buildings of Class II. shall be designed and constructed as is required in Sections 1013 and 1023.

**Roofs.**—Shingle.—See Section 1021.

**Towers, Domes and Spires.—Construction of.**—See Section 1026.

**Walls.**—Around Stairs, Elevators and Shafts.—See Section 998.

## ARTICLE VI.

### PROVISIONS RELATING SOLELY TO CLASS III.

**Sec. 300. (Class III.)**—In Class III. shall be included every building used as a family residence; also every building used for stabling purposes, where such building so used shall occupy a ground area of less than five hundred square feet.

**Sec. 301. (Walls of Class III.—Thickness of.)**—Buildings of Class III. shall conform to the following requirements:

209 to 211—277 to 279,    \*—280,    300—,    301—281

The thickness of enclosing walls of buildings of this class shall be in accordance with the following table, to wit:

		STORIES											
	Basement.	1	2	3	4	5	6	7	8	9	10	11	12
Basement and .....	12	8											
Two-story .....	12	12	8										
Three-story .....	16	12	12	12									
Four-story .....	20	16	16	12	12								
Five-story .....	20	16	16	16	12	12							
Six-story .....	20	20	16	16	16	12	12						
Seven-story .....	24	24	20	20	16	16	12	12					
Eight-story .....	24	24	24	20	20	16	16	12	12				
Nine-story .....	28	24	24	20	20	20	16	16	12	12			
Ten-story .....	28	24	24	24	20	20	20	16	16	12	12		
Eleven-story .....	28	28	24	24	24	20	20	20	16	16	12	12	
Twelve-story .....	32	28	28	24	24	24	20	20	20	16	16	12	12

Provided, however, in buildings of steel skeleton fireproof construction, thickness of walls shall be governed by the provisions of Section 911 of this chapter.

Sec. 302. (Buildings.—Construction Of.—Height Of.)—Buildings of Class III. which are one hundred feet or more in height shall be made entirely of fireproof construction.

Buildings of Class III. less than one hundred feet and more than sixty feet in height shall be built entirely of slow-burning mill or fireproof construction.

Buildings of Class III. less than sixty feet in height may be built of ordinary construction.

Sec. 303. (Skylights.—Construction Of.—Glass In.)—The skylight on the roof of any building of Class III., other than a frame building, shall have the sides, sashes and frames constructed of metal, or of wood metal clad on all exterior surfaces. If the building exceed three stories in height, such skylight shall have at least six inches over same a strong wire netting (wire not lighter than No. 8 and mesh not coarser than  $1\frac{1}{2} \times 1\frac{1}{2}$  inches), unless the glass contains a wire netting within itself.

Sec. 304. (Loads.—Allowance for Live Loads in Construction of Floors of Class III.)—For all buildings of Class III. the floors shall be designed and constructed in such manner as to be capable of bearing in all their parts, in addition to the weight of floor construction, partitions and permanent fixtures and mechanisms that may be set upon the same, a live load of forty pounds for every square foot of surface in such floors.

Sec. 305. (Rooms of Class III.—When Considered Habitable.)—In buildings of Class III., no room shall be considered habitable or used as a habitation unless it has at least one window of an area equal to one-tenth of the superficial area of such room opening into the external air.

Sec. 306. (Fire Walls.—Thickness Of.—When Dispensed With.)—In buildings of Class III., fire walls of brick not less than twelve inches thick shall be built, extending above the roofs of all buildings, if such roofs are flat, and also above the roofs of all buildings where the same abut against another building, or where the same stands upon any line of any lot, excepting street or alley lines. Provided, that where eight-inch walls are permitted in the top story of buildings, or where the building is not over three stories high, the fire walls may be eight inches thick. Such fire walls, where they stand upon lot lines or where they are over the dividing walls between buildings, or over the dividing walls in the interiors of buildings, where such are required by the provisions of this chapter by reason of the great area of such buildings, shall extend at least two feet above the roofs of such buildings. Fire walls upon street and alley lines shall extend not less than eighteen inches above the roofs of such buildings. Fire walls may be dispensed with on street and alley lines, if the tops of the roof boards and roof joists are protected against fire for a distance of at least five feet from such street or alley lines by a coating of mortar or hollow tile or porous tile at least two inches thick. Fire walls at street and alley lines may also be dispensed with in all cases where the entire framing and material of the roof is made strictly fireproof.

Walls facing upon courts and light shafts shall be treated as in the same category with walls facing upon streets and alleys.

Fire walls shall be covered with a weatherproof coping of incombustible material.

Sec. 307. (Bay Windows and Light Shafts.—Material For.)—Bay or oriel windows and light shafts may be built of combustible material in buildings of Class III. of two stories or less in height, provided, such bay and oriel windows or light shafts shall not have a greater width than twelve feet at wall line of building, and, provided, that the outside walls, roofs and soffits of such bay or oriel windows and light shafts,

when so constructed, shall be covered with sheet metal or other incombustible material. In all other cases, bay and oriel windows and light shafts and their supports shall be constructed entirely of incombustible material.

**Sec. 308. (Walls.—Brick Wall Upon Wooden Sills.—Level of Sills Allowed.)**—All buildings of Class III. not exceeding one story in height and twenty feet in height from top of sills to highest point of roof, and with side walls not exceeding fourteen feet in height, and with floor area not exceeding one thousand two hundred square feet, may have brick walls not less than eight inches in thickness erected on wooden sills, the sills supported on iron, masonry or concrete supports extending four feet below the surface of the ground. The foundations under such supports shall be of concrete, stone or brick, each covering not less than five square feet area and not more than eight feet apart to support the weight that may rest upon them with safety; sills shall be placed not higher than four feet above the established grade on the street fronting the lot upon which the building is erected, where grades are established, and not exceeding seven feet above the ground where grades are not established. In all cases of buildings being more than one story and less than two stories high, and having a gable or hip roof of not less than one-third (1-3) pitch, 8-inch walls on solid brick or stone masonry may be used, provided they do not exceed 14 feet in height measured from first floor joist, and provided such buildings have a floor area not exceeding one thousand two hundred (1,200) feet, and are not over twenty-two feet in width.

## ARTICLE VII.

### PROVISIONS RELATING SOLELY TO CLASS IV.

**Sec. 400. (Class IV.)**—In Class IV. shall be included every building used as an assembly hall, whether such hall is used for the purpose of worship, instruction or entertainment, unless such building is used for any of the purposes for which buildings of Class V. or Class VIII. are used.

**Sec. 401. (Walls.—Outside Walls of Class IV.—Structures Built Above.—Walls Of.)**—The outside walls of all buildings used wholly or in part for the purposes of Class IV., the roof or ceiling of which is carried on trusses or girders of a span of fifty feet or more, shall be as follows:

If such walls are less than twenty-five feet high, not less than twenty inches thick.

If they are more than twenty-five feet high and less than forty-five feet high, they shall not be less than twenty-four inches thick.

If they are more than forty-five feet and less than sixty feet high, they shall not be less than twenty-eight inches thick.

If they are more than sixty feet and less than seventy-five feet high, they shall not be less than thirty-two inches thick.

If they are more than seventy-five feet and less than ninety feet high, they shall not be less than thirty-six inches thick.

An increase of four inches in thickness of such walls shall be made in all cases where they are over one hundred feet long without cross walls of equal height.

Walls around stairs, elevators and shafts. See section 998.

For rooms used for the purposes of Class IV., where such rooms are less than fifty feet wide in the clear, the thickness of the walls enclosing or surrounding such rooms may be reduced by four inches.

The outside walls of all buildings of Class IV., the roof or ceiling of which is not carried on trusses or girders, shall be of the same thickness as in buildings of Class I.

If on or more stories are built above the room or rooms, or portion of any such building devoted to the uses of Class IV., and such stories are carried on trusses or girders, the thickness of walls shall be increased by four inches for each two stories or part thereof above every such room.

If solid masonry buttresses are employed, and placed eighteen feet or less apart, and extended to the foot of the trusses or girders carrying the ceiling, or if iron or steel pillars are inserted in such walls for the support of the superstructure, and

at distances not more than twenty-four feet between centers, and if such pillars extend to and carry the superimposed trusses and girders, the thickness of such walls may be reduced in proportion to the increase of strength afforded by such buttresses or pillars; but in no case shall any such wall be less than twelve inches thick in the top story; four inches shall be added, going downward, for each story, or for each twenty-five feet in height of wall. Provided, that if in any building of this class now in existence the structural parts thereof do not comply with the foregoing requirements, and structural changes are made therein, then all walls, columns or other structural parts shall be strengthened in a manner satisfactory to the Commissioner of Buildings.

Sec. 402. (Walls.—Columns In.)—If iron or steel columns are introduced in such walls, the brickwork around the same shall be bonded into that of the connecting walls, and each of such columns shall be fireproofed, as provided in Section 912 of this chapter.

Sec. 403. (Frontage of Class IV. Seating Less Than 800.)—Buildings of Class IV., containing halls of an aggregate seating capacity of eight hundred persons or less, shall have for each hall a frontage upon two public spaces, of which at least one shall be a street, and of which the other, if it is not a street, shall be a public or private alley, not less than ten feet wide, opening directly on a public street.

Sec. 404. (Frontage of Class IV.—Seating Over 800.)—Buildings of Class IV., containing halls or rooms used for the purposes of Class IV. of greater aggregate seating capacity than eight hundred, shall have for each hall a frontage upon three open spaces, of which at least one shall be a public street, while the two others, if not streets, shall be public or private alleys of a width of not less than ten feet each, opening directly on a public street, or fireproof passageways or tunnels of not less than seven feet each in width may be used in place of these alleys, provided, such passageways or tunnels lead to a public thoroughfare.

Sec. 405. (Buildings, Class IV—Construction of.)—Amended Dec. 1, 1905, to read as follows:

*Buildings of Class IV., containing halls of an aggregate seating capacity of not more than eight hundred, may be built of ordinary construction. If such halls have a greater aggregate seating capacity than eight hundred (800) and less than one thousand five hundred (1,500), such building shall be built of mill, slow-burning, or fireproof construction. If such hall have an aggregate seating capacity of one thousand five hundred (1,500) or more, such buildings shall be built entirely of fireproof construction, provided that buildings mainly used for exposition or exhibition purposes, and not exceeding two stories in height, or having for public use only a main floor and one gallery, and which have their outside walls and structural members of incombustible material and which comply in all other respects with this ordinance, may have their temporary seats, boxes, show-cases, platforms, or booths, constructed of combustible material.*

In computing the seating capacity of any room or building used for the purposes of Class IV., in which the seats are not fixed, an allowance of eight square feet of floor area shall be made for each person, and all space between the walls or partitions of such room or building shall be measured in this computation.

Sec. 406. (Buildings of Class IV., Used Partly for Other Purposes.)—Any building occupied wholly or in part for the purposes of Class IV., shall be built entirely of fireproof construction, if the halls or rooms used for the purposes of Class IV. therein have an aggregate seating capacity greater than one thousand five hundred.

Sec. 407. (Buildings of Certain Height.—Construction Of.)—Any building higher than sixty feet and connected with or made part of any building used wholly or in part for the purposes of Class IV., shall be entirely of fireproof construction. Any such building less than sixty feet in height shall, if its case is not already covered by other provisions of this chapter, be made of fireproof, slow-burning or mill construction.

Sec. 408. (Openings Between Non-Fireproof Buildings.)—In all cases where fireproof construction is not used for the whole of two or more connected buildings, used wholly or in part for the purposes of Class IV., there shall be at each connecting opening double iron doors.

Sec. 409. (Spires, Cupolas and Domes Upon Houses of Worship.)—Spires, cupolas or domes with a framework of non-fireproof material and covered on the outside with incombustible material, may be erected as part of any house of public worship, and if such house of worship is so built that it is nowhere nearer than twenty feet to any line of the lot upon which it stands (street and alley lines excepted), such non-fireproof spires, cupolas or domes may be maintained only while this intervening space of twenty feet is maintained unoccupied as part of the grounds or premises belonging to such house of public worship.

**Sec. 410. (Violation.—Spires, etc., to Be Taken Down.—Roofs of Isolated Buildings of Class IV.)**—If the conditions of such building be so changed that there shall not be a vacant space as hereinbefore required surrounding same, such spire, cupola or dome shall be forthwith taken down.

The roofs of isolated buildings, occupied for purposes of Class IV., shall be constructed in the same manner as that provided for spires, domes and cupolas.

Provided, however, that the roofs of houses of worship outside the fire limits not exceeding twenty-eight hundred square feet in area may be covered with shingles.

**Sec. 411. (Floor Levels.—Limitation of Floor Levels of Class IV.—Auditorium Floor of Class IV.—Height Above Sidewalk.—Stairs.)**—The following limitations of floor levels in buildings occupied either wholly or in part for purposes of Class IV. shall be observed in all cases.

In buildings occupied either wholly or in part for purposes of Class IV., no auditorium of a greater seating capacity than one thousand shall have the highest part of its main floor at a greater distance than ten feet above the adjacent sidewalk grades. No room or rooms used for the purposes of Class IV., of greater seating capacity than five hundred, shall be at a greater distance from the sidewalk grade than thirty feet. No room or rooms used for the purpose of Class IV., of greater seating capacity than two hundred, shall be at a higher level above the sidewalk grade than forty-five feet.

Provided, however, that in the case of a building used either wholly or in part for the purposes of Class IV., and built wholly of fireproof construction, a room or rooms to be used for the purposes of Class IV., and of an aggregate seating capacity of less than five hundred, may be located in any story thereof, but in such case there shall be at least two separate and distinct flights of stairs from the floor or floors in which such room or rooms are located to the ground, each of which stairs shall be not less than four feet wide in the clear.

**Sec. 412. (Loads, Allowance for Live Loads in Construction of Floors of Class IV.)**—All floors of all buildings of Class IV. shall be designed and constructed in such manner as to be capable of bearing in all their parts, in addition to the weight of floor construction, partitions and permanent fixtures and mechanisms that may be set upon the same, a live load of one hundred pounds for every square foot of surface in such floor.

**Sec. 413. (Stairways.—Entrances and Exits, Width of.)**—The width of stairways in buildings used wholly or in part for the purposes of Class IV. shall be eighteen inches for every one hundred of the aggregate seating capacity of all rooms in such building, which are used for the purposes of Class IV., and for fractional parts of each one hundred seating capacity a proportionate part of eighteen inches shall be added to the width of such stairways, but no stairway in such building shall be less than four feet wide in the clear, except as hereinafter provided; and provided, further, that in any such building having a room or rooms used for purposes of Class IV., the aggregate seating capacity of which shall not exceed two hundred and fifty, two separate and distinct three-foot stairways shall be permitted.

All stairways shall have hand railings on each side thereof. Stairways which are over 7 feet wide shall have double intermediate handrails, with end newel posts at least 5½ feet high. No stairways shall ascend a greater height than thirteen feet six inches without a level landing, which, if its width is in the direction of the run of the stairs, shall not be less than three feet wide, or which, if at a turn of the stairs, shall not be of less width than the width of the stairs.

Stairways leading to a box or boxes, seating not to exceed thirty people in the aggregate, shall be independent of all other stairs or seats and not less than two feet six inches wide in the clear. For each additional twenty-five of seating capacity, or major portion thereof, in such boxes, an additional width of five inches shall be added to such stairways.

**(Walls.—Ledges.)**—See Section 997.

**(Doors and Windows.—When Required to Be Closed.—Fire-Resisting Glass.)**—See Section 1049.

**Sec. 414. (Balconies and Galleries.—Exit and Entrance.)**—Distinct and separate places of exit and entrance shall be provided for each gallery. A common place of exit and entrance may serve for the main floor of the auditorium and the balcony, provided its capacity be equal to the aggregate capacity of all aisles or corridors leading from the main floor and such balcony to such place of exit and entrance.

**Sec. 415. (Balconies and Galleries.—Designation of.)**—Where there are balconies or galleries, the first balcony or gallery shall be designated the "Balcony," and the second and third balcony or gallery shall be designated, respectively, "Gallery" and "Second Gallery." Such designation shall be plainly printed on all admission tickets.

**Sec. 416. (Aisles.—Steps in Aisles.—Passageways.—Kept Unobstructed.—Width of Corridors, Passages, Hallways and Doors.)**—Aisles in rooms or auditoriums used for the purposes of Class IV. shall in the aggregate be eighteen inches in width for each one hundred of the seating capacity of such room or auditorium, and for fractional parts of one hundred, a proportionate part of eighteen inches shall be added; but no aisle shall be less than two feet and six inches in width in its narrowest part.

Steps shall be permitted in aisles only as extending from bank to bank of seats, and whenever the rise from bank to bank of seats is less than five inches the floor of the aisles shall be made as an inclined plane, and where steps occur in outside aisles or corridors, they shall not be isolated, but shall be grouped together and there shall be a light so placed as to illuminate such steps in such outside aisles or corridors. All aisles and passageway in such rooms or auditoriums shall be kept free from camp stools, sofas, chairs and other obstructions, and no person shall be allowed to stand in or occupy any of such aisles or passageways during any performance, service, exhibition, lecture, concert, ball, or any public assembly.

**Sec. 417. (Corridors, Passageways, Hallways and Doors.—Width of.)**—The Width of corridors, passageways, hallways and doors adjacent to, connected with or a part of such rooms or auditoriums, shall be computed in the same manner as is herein provided for stairways and aisles, excepting, however, that no such corridor, passageway or hallway shall be anywhere less than four feet in width, and no such door shall be less than three feet in width.

**Sec. 418. (Seats.—Number of in Rows.)**—There shall not be more than fourteen seats in any one row between aisles.

Rows of seats shall not be less than 2 feet 8 inches from back to back, and no bank of seats shall be of greater rise than 24 inches.

**Sec. 419. (Emergency Exits.)**—Emergency exits and stairways shall be provided outside of the walls of all assembly halls of a larger seating capacity than eight hundred. Provided, however, that if any such assembly hall is used for any of the purposes described in Section 425 of this chapter, and has a seating capacity of more than four hundred, such assembly hall shall have emergency exits to the street of one-half the aggregate width of the main exits, but no such emergency exit shall be less than three feet in width.

Such emergency exits and stairways therefrom may be built inside the walls of the building in a corridor or passageway not less than seven feet wide, which corridor or passageway shall be surrounded by a fireproof partition, not less than four inches thick.

Such stairways shall be made of wrought iron or steel, or other approved fireproof material, and cast iron is not approved for this work. All emergency exits and stairways therefrom shall be kept free from obstruction of any kind, including snow and ice.

**Sec. 420. (Doors to Open Outward.)**—All doors affording access directly or indirectly to the street from any room used for the purposes of Class IV. shall open outward upon suitable hinges.

Exit doors from such rooms shall not be obscured by draperies and shall not be locked, or fastened, in any manner during the entire time any such room is open to the public, but shall be so constructed and maintained that they may be easily opened from the interior.

**Sec. 421. (Walls Between Auditorium and Stage.)**—In buildings used either wholly or in part for the purposes of Class IV. hereafter erected, there shall be a solid brick wall, of the same thickness as that called for on the outside walls, between the auditorium and stage; and in non-fireproof buildings such walls shall extend to a height of three feet above the roof. Provided, however, that in existing buildings, any room used for the purposes of Class IV., and having a seating capacity greater than four hundred, shall have the proscenium wall built of incombustible material.

**Sec. 422. (Curtain Shall Be Iron, Steel or Asbestos.—Inspection Of.—Fee.)**—The main curtain opening in any such room shall have a wrought iron or steel or asbestos curtain, which shall be inspected by the building department semi-annually, for which inspection a charge of two dollars shall be made, and all other openings in the proscenium wall shall have self-closing iron doors.

**Sec. 423. (Structures Over Ceiling.—Construction.)**—If any structure is built over the ceiling or roof of any building used either wholly or in part for the purposes of Class IV., the different members of the girders or trusses supporting same shall have their fireproofing double, in the manner required for columns or for fireproof buildings of Class I.

**Sec. 424. (Fire Apparatus on Stage.)**—In all rooms used for the purpose of Class IV. of a seating capacity of two hundred and fifty or more, where stationary

scenery is used, there shall be kept for use two or more portable fire extinguishers or hand fire pumps on and under the stage, and also four fire department axes, two fifteen-foot hooks and two ten-foot hooks on each tier or floor of the stage, subject to the approval of the Fire Marshal, and in such rooms of less seating capacity than two hundred and fifty, there shall be at least one portable fire extinguisher.

**Sec. 425. (Rooms Used for Regular Theatrical or Vaudeville Performances.—Exit Doors.)**—Exit doors shall not be obscured by draperies and shall not be locked or fastened in any manner during the entire time any such room of Class IV. is open to the public, so as to prevent them from being easily opened outwardly; and such doors shall be so constructed and maintained, as to require no special knowledge or effort to open them from the interior.

It shall be the duty of every person, or corporation, operating or maintaining any room, having a seating capacity of three hundred or more, used for the purposes of Class IV., and which is used regularly for theatrical or vaudeville performances and where an admission fee is charged, to employ one competent, experienced fireman, who shall be detailed by the Fire Marshal, and who shall be in the uniform of the Chicago Fire Department. Such fireman shall be on duty during the whole time such room is open to the public, and he shall report to and be subject to the orders of the Fire Marshal; he shall see that all fire apparatus required by this chapter is in its proper place and in proper condition ready for use, and that all exits are unlocked during the whole time such building is open to the public.

Such fireman and the Fire Marshal shall require all persons employed in or about such room to be drilled in the use of all apparatus and appliances for the prevention of fire installed therein, at least twice in every week, and such fireman shall report to the Fire Marshal the manner and efficiency of such drill. Such fireman shall report in writing daily to the Fire Marshal the condition and equipment of the building, or portion thereof, to which he is detailed. No fireman shall be on duty at any one building for a longer period than two weeks.

**Sec. 426. (Standpipe and Hose on Stage.)**—A standpipe not less than one and one-half inches in diameter, with a hose connection and hose valve therein, shall be installed on each side of the stage in such room, and shall at all times have a hose connected thereto, ready for use.

Such standpipe shall be connected with a power pump or gravity tank so that a sufficient pressure of water shall be furnished through such standpipe to afford adequate fire protection. The pressure to be furnished by such tank or pump shall be satisfactory to the Fire Marshal.

**Sec. 427. (Vents or Flue Pipes.)**—One or more vents or flue pipes of metal construction or other incombustible material approved by the commissioner of buildings shall be built over the stage, and shall extend not less than ten feet above the highest point of the roof, and shall be equivalent in area to one-twentieth of the area of the stage.

In buildings where additional stories are built above the stage, such vents or flue pipes may be carried out near the top of the stage walls, and shall be continued and run up on the exterior of the building to a point five feet above the highest point of the additional stories.

All such flues or vents shall be provided with metal dampers, and shall be opened by a closed circuit battery, approved by the City Electrician.

Such dampers shall be controlled by two switches, one at the Electrician's station on the stage, which station shall be fireproof, and the other at the city fireman's station on the opposite side of the stage; such switches shall be located in such places on the stage as may be designated by the Fire Marshal, and each switch shall have a sign with plain directions as to the operation of same printed thereon.

**Sec. 428. (Fuse Boxes.)**—All fuse boxes shall be surrounded by two thicknesses of fireproof material, with an air space between, and no fuse shall be exposed to the air between the switchboards; all electrical equipment in such rooms shall be installed and maintained to the satisfaction and approval of the City Electrician.

**Sec. 429. (License.)**—The amusement license for each room used for the purposes of Class IV. shall state the number of persons such room has accommodations for, which number shall be governed by the provisions of this chapter relating thereto, and no more than that number shall be allowed to be in such room at any one time.

No amusement license shall be issued for any room used for the purposes of Class IV. unless the Commissioner of Buildings, the Fire Marshal and the City Electrician shall first have certified, in writing, that such room complies with the provisions of this ordinance in every respect.

**Sec. 430. (Exits.—Diagram of Printed on Programs.)**—It shall be the duty of the owner, lessee, or manager of every room used for the purposes of Class IV.,

and in which programs are issued for performances given therein, to cause to be printed on such programs a diagram showing conspicuously the exits from such room.

**Sec. 431. (Exit.—Signs Over.)**—The word "Exit" shall be in letters at least six inches high over the opening to every means of egress from any such room, and in any such room having a greater seating capacity than four hundred, a red light furnished by gas or sperm oil shall be kept burning over such word during the entire period such room is open to the public and until the audience has left such room.

**Sec. 432. (All Parts of Room Well Lighted During Performance.)**—Every portion of any room used for the purposes of Class IV. and all outlets therefrom leading to the streets, including the passageways, courts and corridors, stairways, exits and emergency exit stairways, shall be well and properly lighted during every performance, and the same shall be kept so lighted until the entire audience has left the premises; and every passageway, or court, or corridor, or stairway, or exit, or emergency exit stairway, shall be provided with signs, indicating the way out of the building, the letters of which shall not be less than six inches in height.

**Sec. 433. (Lights in Halls, Corridors and Lobbies, Control of.—Separate Shut-Off.—Connection with Gas Mains.—Protection of Suspended and Bracket Lights.—Protection of Lights Inserted in Walls.—Protection of Foot Lights.—Construction of Border Lights.—Ducts and Shafts Conducting Heated Air from Lights.—Protection of Stage Lights.)**—All gas or electric lights in the halls, passageways, corridors, lobby or other means of ingress to or egress from any such room shall be controlled by a separate shut-off, located in the lobby, and controlled only in that particular place. Gas mains supplying any such room shall have independent connections for the auditorium and stage, and provision shall be made for shutting off the gas from the outside of the building. All suspended or bracket lights surrounded by glass, in the auditorium, or in any part of any such room, shall be provided with proper wire netting underneath. No gas or electric light shall be inserted in the walls, woodwork, ceilings, or in any part of any such room, unless protected by fireproof materials. The footlights, if gas light, in addition to the wire network, shall be protected by a strong wire guard, not less than two feet distant from such footlights, and the trough containing such footlights shall be formed of, and be surrounded by, fireproof materials. All border lights shall be constructed according to the best known methods, subject to the approval of the City Electrician, and shall be suspended by wire rope. All ducts and shafts used for conducting heated air from the main chandelier, or from any other light or lights, shall be constructed of metal, and made double, with an air space between. All stage lights, if gas, shall have strong metal wire guards or screens, not less than ten inches in diameter, so constructed that any material coming in contact therewith shall be out of reach of the flame, and such guards or screens shall be firmly soldered to the fixtures in all cases.

The use of calcium lights in any hall or room used regularly for theatrical or vaudeville performances is prohibited, and no calcium lights shall be permitted upon any stage; all arc lights used on the stage shall be subject to the approval of the City Electrician.

**Sec. 434. (Apparatus Under Control of Fire Marshal.)**—The standpipes, hose, and all apparatus for the extinguishing of fire or guarding against the same, required by the provisions of this ordinance to be provided, shall be at all times so provided and kept in a manner satisfactory to the Fire Marshal.

**Sec. 435. (Scenery to Be Incombustible.)**—No scenery or stage paraphernalia of any sort shall be used upon the stage of any room used for the purposes of class IV., unless such scenery and paraphernalia shall have been treated with a paint or chemical solution which shall make it non-inflammable, and which treated scenery or stage paraphernalia, or both, shall be tested and approved by the Fire Marshal.

**Sec. 436. (Commissioner of Buildings, City Electrician, Fire Marshal and Superintendent of Police Empowered to Enter.)**—The Commissioner of Buildings, City Electrician, Fire Marshal, Superintendent of Police, and their respective assistants, shall have the right to enter any building used wholly or in part for the purposes of Class IV. and any and all parts thereof, at any reasonable time, and at any time when occupied by the public, in order to examine such building, and it shall be unlawful for any person to interfere with them in the performance of their duties.

**Sec. 437. (Power of Officers to Close.)**—The Commissioner of Buildings, Fire Marshal, City Electrician or Superintendent of Police, or any one of them, shall have the power, and it shall be their joint and several duty, to order any building used wholly or in part for the purposes of Class IV. closed, where it is discovered that there is any violation of any of the provisions of this article, until the same are complied with.

Sec. 438. (**License.—Mayor Shall Revoke.**)—Upon the report to the Mayor by the Commissioner of Buildings, Fire Marshal, City Electrician, or Superintendent of Police, or any of them, that any order or requirement of this article in regard to buildings used wholly or in part for the purposes of Class IV. has been violated or is not being complied with, in any such building, the Mayor shall revoke the amusement license of any amusement or entertainment therein conducted, and shall cause such building, or portion thereof, devoted to the uses of Class IV., to be closed.

## ARTICLE VIII.

### PROVISIONS RELATING SOLELY TO CLASS V.

#### Buildings of Class V. Now in Existence.

Sec. 500. (**Class V.**)—In Class V. shall be included every building which is used as a public theater where an admission fee is charged and in which movable scenery is used; provided, however, that public halls and club halls, with a seating capacity of less than six hundred, although occasionally used for theatrical representations, shall not be construed to be public theaters within the meaning of the term as used in this section, notwithstanding the fact that movable scenery is used upon the stage thereof on such occasions, and such public halls and club halls shall not be considered as buildings of Class V. as herein defined. Such public halls and club halls shall be included in Class IV., as defined in Section 400 of this ordinance.

Sec. 501. The following provisions shall apply to buildings now in existence and used wholly or in part for the purposes of Class V.

Sec. 502. (**Walls.—Outside.—Structures Built Above.**)—The outside walls of all such buildings, the roofs or ceilings of which are carried on trusses or girders of a span of fifty feet or more, shall be as follows:

If such walls are less than twenty-five feet high, they shall be not less than twenty inches thick.

If they are more than twenty-five feet and less than forty-five feet high, they shall be not less than twenty-four inches thick.

If they are more than forty-five feet and less than sixty feet high, they shall be not less than twenty-eight inches thick.

If they are more than sixty feet and less than seventy-five feet high, they shall be not less than thirty-two inches thick.

If they are more than seventy-five feet and less than ninety feet high, they shall be not less than thirty-six inches thick.

An increase of four inches in thickness of such walls shall be made in all cases where they are over one hundred feet long, without cross-walls of equal height.

The thickness of the walls enclosing or surrounding rooms used for the purposes of Class V., where such rooms are less than fifty feet wide, may be reduced by four inches.

If one or more stories are built above any room devoted to the uses of Class V., and such stories are carried on trusses or girders, the thickness of walls shall be increased by four inches for each two stories or part thereof above such room.

If solid masonry buttresses are employed and placed eighteen feet or less apart, and extended to the foot of the trusses or girders carrying the ceiling, or if iron or steel columns are inserted in such walls for the support of the superstructure, and at a distance not more than twenty-four feet between centers, and if such columns extend to and carry the superimposed trusses and girders, the thickness of such walls may be reduced in proportion to the increase of strength afforded by such buttresses or columns, but in no case shall any such wall be less than twelve inches thick in the top story, and four inches shall be added, going downward, for each story, for each gallery, or for each twenty-five feet in height of wall. Provided, that if in any such building now in existence the structural parts thereof do not comply with the foregoing requirements and structural changes are made therein, then all walls, columns or other structural parts shall be strengthened in a manner satisfactory to the Commissioner of Buildings.

Sec. 503. (**Columns in Walls.**)—If iron or steel columns are introduced in such walls, the brick work around the same shall be bonded into that of the connecting walls, and each of such columns shall be fireproofed as provided in Section 912 of this chapter.

Sec. 504. (**Alterations.**)—All alterations in such existing buildings intended to make them comply with the requirements of this chapter may be executed with the same kind of materials as those originally used in the construction of such buildings, unless otherwise provided by this chapter.

**Sec. 505. (Other Classes Built in Conjunction with Class V.—Doors for Openings Between Connecting Buildings.)**—In all cases where existing buildings used wholly or in part for the purposes of Class V. are built in conjunction with or as part of buildings devoted to the uses of other classes, and where such buildings of the other classes, as specified in this chapter, are not built entirely of fireproof construction, double iron doors shall be placed at each connecting opening between such buildings of Class V., and the building connected therewith.

**Sec. 506. (Floor Levels.—Limitations of.)**—The audience room or rooms or auditorium or auditoriums used for the purposes of Class V., containing in the aggregate not more than five hundred seats, if in a fireproof building, may be located in any story thereof, but in such case there shall be at least two separate stairways from the floor or floors in which such audience room or auditorium is located to the ground, each of which stairways shall be not less than four feet in width in the clear.

In existing buildings of fireproof construction, having an audience room or an auditorium with a seating capacity of more than five hundred feet and less than fifteen hundred, the lowest bank of seats of the main floor thereof shall be not more than twelve feet above the street level, and every such building shall in all other respects conform to the requirements of this chapter. The main floor of no existing theater of any construction other than fireproof shall be raised above its present elevation.

**Sec. 507. (Loads.—Allowance for Live Loads in Construction of Floors of Class V.)**—For all buildings of Class V., all floors shall be designed and constructed in such manner as to be capable of bearing in all their parts, in addition to the weight of floor construction partitions and permanent fixtures and mechanisms that may be set upon the same, a live load of one hundred pounds for every square foot of surface in such floors.

**Sec. 508. (Stairways.—Entrances and Exits.)**—Stairways affording ingress to or egress from any room or rooms used for the purposes of Class V. shall be in width equivalent to twenty inches for every one hundred of seating capacity of such room and for fractional parts of one hundred a proportionate part of twenty inches of width shall be added, but in no event shall any such stairway be less than four feet wide in the clear, except as hereinafter provided in this section.

All such stairways shall have hand railings on each side thereof and shall not ascend a greater height than thirteen feet six inches without a level landing, and the length and width of such landing shall not be less than the width of the stairs; no run of stairs shall consist of less than six risers between platforms, and risers shall not be placed on return platforms. Stairways which are over 7 feet wide shall have double intermediate handrails, with end newel posts at least 5½ feet high.

Steps shall not have a greater rise than seven and three-eighths inches, treads shall not be narrower than eleven inches, and winders shall not be used on any staircase, except where circular staircases are expressly permitted.

In existing theaters each and every balcony and gallery shall have separate and distinct entrance stairways from the sidewalk level, except that in cases where the vestibule or entrance to any such theater is not more than fifteen inches, or two steps, above the sidewalk level and such steps are at or near the building line, the stairways to such balcony and gallery may ascend from the floor of such vestibule or entrance, but if the run of the stairs at the bottom is not toward the street, there shall be a hand rail or rails three feet above the floor constructed from the foot of such stairways for a distance of not less than five feet leading toward the street. All doors intervening between such stairways and the street shall, during each and every performance, be kept unfastened.

There shall be an iron stairway or stairways from the stage to the fly galleries and gridiron, continuing to the roof of the building or to some fireproof passageway or exit. Such stairways may be circular. Such circular stairways, however, shall not be used for access to the dressing rooms.

Stairs leading to a box or boxes seating not to exceed thirty people, in the aggregate, shall be independent of all other stairs and seats and not less than two feet eight inches wide in the clear. For each additional twenty-five of seating capacity, or major portion thereof, there shall be an additional width of five inches added to such stairways.

All stairways on the stage side of the proscenium wall shall be not less than two feet six inches wide.

Instead of increasing the width required for entrances, aisles, exits and stairways to that required by this chapter, the owner, lessee or manager of any such theater shall have the privilege of reducing the number of permanent seats therein until the same ratio between such width and number of seats as hereinbefore provided for shall be established, and if such privilege be taken advantage of, it shall be the

duty of the Commissioner of Buildings to make inspection and certify that such ratio actually exists before a license for the operation of any such theater shall be issued.

Sec. 509. (**Floors at Exits.**)—Floors at all exits shall be so designed as to be level and flush with adjacent floors and shall extend for an unbroken width of not less than four feet in front of each exit, and shall be two feet wider than such exit.

Sec. 510. (**Seats in Rows Between Aisles.**)—More than ten seats in any row between aisles in any gallery shall not be permitted. On the main floor and balcony, not more than eleven seats between aisles shall be permitted; provided, however, that in banks of seats on main floors and balconies that are not at a greater distance than twenty feet from an exit, thirteen seats shall be permitted between aisles.

Seats shall be not less than twenty inches in width, measured at the top of the seat backs.

Rows of seats shall be not less than two feet eight inches from back to back.

No bank of seats shall be of greater rise than twenty-two inches.

All groups of seats shall be so arranged that there shall be an aisle at each side of each group, provided, however, that groups of five seats or less may abut upon a tunnel at one side and an aisle at the other side.

The number of banks of seats on the main floor shall not exceed fifteen, unless an intervening or cross aisle is provided between each fifteen banks of seats or a direct exit is provided for each aisle.

The number of banks of seats in the balcony shall not exceed nine unless an intervening or cross aisle is provided between each nine banks of seats or a direct exit is provided for each aisle.

Sec. 511. (**Tunnels.—Cross Aisles.—Vertical Rise.**)—There shall be no more than twelve feet rise, measured vertically, in any aisle in any gallery without a direct exit by tunnel or otherwise to a corridor with free opening on to the gallery stairs or other direct discharge to the street, or at such elevation of twelve feet an intervening or cross aisle leading directly to an exit. No tunnel shall be less than three feet wide in the clear.

Sec. 512. (**Foyer.**)—No foyer shall be open to the theater proper except through the exits.

Sec. 513. (**Main Floor.—Balcony and Gallery.—Designation of.**)—The lower floor of all theaters shall be designated the "Main Floor."

Where there are balconies or galleries, the first balcony or gallery shall be designated the "Balcony" and the second and third balcony or gallery shall be designated, respectively, "Gallery" and "Second Gallery." Such designation shall be printed plainly on all admission tickets.

Sec. 514. (**Aisles, Corridors and Passageways.—Kept Unobstructed.**)—The minimum width of aisles with diverging sides in any room or auditorium used for the purposes of Class V. shall be two feet eight inches at the end near the stage and not less than three feet at the other end.

The minimum width of aisles with parallel sides shall be three feet.

Every aisle shall lead as nearly as possible directly to an exit, but in no case shall the center line of such exit be more than three feet from the center line of any such aisle leading thereto.

Sec. 515. (**Steps in Aisles.**)—Steps shall not be permitted in aisles except as extending from bank to bank of seats and no riser shall be greater than seven and three-eighths inches, and no tread shall be less than nine and one-half inches, and whenever the rise from bank to bank of seats is less than five inches, the floor of the aisles shall be made as an inclined plane, and where steps are placed in outside aisles or corridors they shall not be isolated, but shall be grouped together and a light shall be maintained so that every place where there are steps in inclosing aisles or corridors shall be clearly lighted.

Sec. 516. (**Aisles Passageways, Corridors and Exits.**)—All aisles, passageways, corridors and exits shall be free from camp stools, chairs, sofas and other obstructions, and no person shall be allowed to stand in or occupy any such aisles, passageway, corridors or exits during any performance, service, exhibition, lecture, concert or any public assemblage.

Sec. 517. (**Corridors, Passageways, Hallways and Doors.—Width Of.**)—The width of corridors, passageways, hallways and doors shall be computed in the same manner as that hereinbefore provided for stairways, excepting, however, that no corridor shall be anywhere less than four feet in width, and no door less than three feet wide, except as otherwise herein provided.

All corridors, passageways, hallways and stairways leading from any balcony or gallery to any toilet room, retiring room, smoking room, check room or private office,

shall permit of free passage, without returning to an outer exit of the building. Such corridors, passageways, hallways and stairways shall be at least three feet in width in every part between such balcony or gallery and such outer exit, and shall be unobstructed in every part except by doors, not less than three feet in width in the clear, which shall swing outward and which shall not be provided with locks or catches of any kind whatever.

**Sec. 518. (Doors.—Entrance.)**—The entrance door to every theater shall be of sufficient width to accommodate the entire audience, computed on the basis of twenty inches in width in the clear to each hundred permanent seats, and in addition thereto a proportionate part of twenty inches for a fractional part of each one hundred seats in the audience room or auditorium.

No mirrors shall be so arranged as to give the appearance of a doorway, exit, hallway or corridor, when no such doorway, exit, hallway or corridor is really in existence, nor shall there be any false doors or windows giving the appearance of an opening where none really exists.

**Walls.—Ledges.**—See Section 997.

**Doors and Windows.—When Required to be Closed.—Fire-resisting Glass.**—See Section 1049.

**Sec. 519. (Emergency Exits.—Width.—Emergency Stairs.—Width.—Emergency Exits Inside Walls of Buildings.—Fire Escapes.—Construction.—Fire Escapes Leading to Street or Alley.—Doors Open Outward.)**—Emergency exits and stairways shall be provided separately for each floor, balcony and gallery. They shall be of the same aggregate width as that provided for the main exits, and no emergency exit, doorway or stairway shall be less than three feet in width. Such emergency stairways shall be made of iron, steel or other incombustible materials. Such emergency exits shall be kept free of obstructions of any kind, including snow and ice.

Such emergency exits and stairways may be built inside the walls of the building, provided they are surrounded by a fireproof partition not less than four inches thick separating the exits and stairways from the audience room or auditorium.

If such emergency exits lead outside the building, all openings leading thereto shall have metal frames filled with fire-resisting glass doors opening outward hung from the inside corner of the jambs, and so constructed as not to project, when opened, beyond the outside face of wall, and outer shutters shall not be permitted.

Whenever any such emergency stairway passes over an exit door or window or other opening, such stairway shall be completely inclosed for a space of five feet greater in width than such opening by iron, steel or other incombustible material.

All such emergency exits and stairways shall land at the ground level in a public thoroughfare or in some space that connects directly with a street or alley and direct and immediate exit to such public thoroughfare shall not be obstructed by any doors, gates, bars or other obstruction of any character.

Every court in which there is an emergency stairway shall have direct and unobstructed access along the surface of the ground to a street, alley or yard opening into an alley or street, without entering into or passing through or over any building unless by a four-foot wide fireproof passage on the court or ground level.

All doors in openings from any and all stairways shall be so constructed that when opened they shall not obstruct any portion of any other doorway, opening or passageway.

All doors affording ingress to or egress from any theater shall open outward upon suitable hinges.

**Sec. 520. (Exit Doors.—Particulars as to.)**—Exit doors shall not be obscured by draperies and shall not be locked or fastened in any manner during the entire time such theater is open to the public, so as to prevent them from being easily opened outwardly; and such door shall be so constructed and maintained as to require no special knowledge or effort to open them from the interior.

**Sec. 521. (Wall.—Brick Proscenium Wall Between Auditorium and Stage.—Steel Curtain Fireproofed on Stage Side.—No Combustible Material on Audience Side.—Plans for Curtain.—Permit from Building Department.—Inspection.—Fee.)**—There shall be in every theater a solid brick wall of the same construction and thickness as is required in outside walls between the auditorium and the stage. The main proscenium opening shall have a substantial steel curtain vertically operated and fireproofed on the stage side, which shall be raised and lowered by mechanical power and which shall be in constant use as the regular curtain and act drop.

No combustible material other than painted decorations shall be applied to the audience side of such curtains.

Plans for such curtain shall be approved by the building department and a permit obtained for its erection. The building department shall inspect such curtain semi-annually, for which inspection a fee of two (2) dollars shall be charged.

All other opening in such proscenium wall shall have iron doors, frames and thresholds.

**Sec. 522. (Stage Construction Of.—Fireproof Paint.—Scenery.—How Treated.)**—The framing of the floor of every stage shall be of iron or steel. The stage floor may be of wood, but shall not be less than two and three-fourths inches thick. The entire floor construction and floor of fly galleries, rigging lofts and paint gallery, all railings and supports and stanchions thereon, and all sheaves, pulleys and cables and their supports shall be of iron or steel. All woodwork, including the under side of floor boards, and all framing for scenery used on or about the stage shall be coated with a fireproof paint, the qualities of which shall be submitted to and approved by the Commissioner of Buildings. All wood used for floor and floor supports shall be coated on the under side with the same kind of paint.

No scenery or stage paraphernalia of any sort shall be used upon the stage of any room used for the purposes of Class V., unless such scenery and paraphernalia shall have been treated with a paint or chemical solution which shall make it non-inflammable, and which treated scenery or stage paraphernalia, or both, shall be tested and approved by the Fire Marshal.

**Sec. 523. (Vestibule of Stage Doors.)**—All doorways or openings in the rear or sides of the stage shall be vestibuled or protected in a manner satisfactory to the Commissioner of Buildings, so as to protect the curtain, scenery and auditorium against draughts of air.

**Sec. 524. (Vents, Flue Pipes, Size of.—Dampers.—Switches for Dampers.)**—One or more vents or flue pipes, of metal construction, or other incombustible material suitable for carrying away smoke, approved by the Commissioner of Buildings, and extending not less than fifteen feet above the highest point of the roof, and equivalent in area to one-twentieth of the area of the stage, shall be built over the stage.

In buildings where additional stories are built above the stage, such vents or flue pipes may be carried out near the top of the stage walls and shall be continued and run up on the exterior of the building to a point five feet above the highest point of such additional stories.

All such flues or vents shall be provided with metal dampers, and shall be opened by a closed circuit battery approved by the city electrician; such dampers shall be controlled by two switches, one at the electrician's station on the stage, which station shall be fireproof, and the other at the city fireman's station on the opposite side of the stage; such switches shall be located at such places on the stage as are designated by the fire marshal, and each shall have a sign with plain directions as to the operation of same printed thereon.

All fuse boxes shall be surrounded by two thicknesses of fireproof material, with an air space between, and no fuses shall be exposed to the air between the switch-boards.

**Sec. 525. (Automatic Sprinklers.—Location Of.—Tank.—Connections.)**—There shall be provided approved system of automatic sprinklers, with approved automatic closed circuit electric devices connecting the valves regulating the flow of water in the various sprinkler pipes, with the headquarters of the city fire alarm telegraph and such other place or places as the Fire Marshal shall direct, so arranged as to prevent any tampering with the system or the shutting off of the water from the sprinkler pipes without automatic notice to the fire department.

Such system of automatic sprinklers shall be supplied with water from a tank located not less than twenty feet above the level of the highest sprinkler head in the system, and it shall be the duty of the fireman provided for in this chapter to include in his daily report the result of an inspection to determine the sufficiency of water in this tank. Automatic sprinklers shall be placed in the paint room, store-room, property room, scene storage room, carpenter shop and dressing rooms, if such rooms are in or connected with a building used for the purposes of Class V., such tank shall not be connected with a standpipe and ladder system, but shall be filled through a separate pipe from a fire pump, and a three-inch iron pipe shall extend from such tank to the outside of such building, with Siamese connections for fire department use. Such entire automatic sprinkler system and equipment and the location thereof shall be subject to the approval of the Fire Marshal.

**Sec. 526. (Fire Apparatus on Stage.—Hand Fire Pumps.—Fire Materials.—Hot Air Furnaces.)**—A standpipe not less than two and one-half inches in diameter, having a hose valve or valves thereon, shall be installed on each side of the stage, with a hose connection at the stage and at each level above and below the stage, and hose connected thereto at each valve ready for use at all times. Such standpipe shall be connected with a tank on the roof containing not less than three thousand gallons of water, protected from frost, and also with a power pump, all of which shall be

subject to the approval of the Fire Marshal. Portable fire extinguishers or hand fire pumps shall always be kept ready for use on and under the stage; in fly galleries and in rigging lofts, and in addition thereto at least four fire department axes and six pike poles shall be kept ready for use on each tier or floor of the stage, all of which shall be subject to the approval of the Fire Marshal.

The use of ordinary hot air furnaces or stoves is prohibited.

**Sec. 527. (Exits.—Diagram Of, Printed on Program.)**—It shall be the duty of the owner, lessee or manager of any theater, for any performance in which programs are issued, to cause to be printed on such programs, on the page opposite that upon which the cast is printed, a diagram showing conspicuously all exits of such building. A diagram of seats of each floor, and the exits leading from each floor drawn to a scale of one-eighth inch to the foot, shall be hung in a frame within two feet of the ticket seller's window and so as to be easily seen by the public.

**Sec. 528. (Lighting.—Independent Lighting System for Exits.—Red Light Over Exits.)**—All stairways and corridors shall be supplied with a supplementary lighting system of electricity, gas or sperm oil, and such system shall be independent of all other lights in such building and shall be in operation during the entire period such theater is open to the public and until the audience has left the building. The word "EXIT" shall be in letters at least six inches high over the opening to every means of egress from such theater and a red light furnished by gas or sperm oil shall be kept burning over such word "EXIT" at every such opening, during the entire period such theater is open to the public and until the audience has left the building.

**Sec. 529. (Fire Alarm Apparatus.)**—Every theater shall be provided with an approved system of automatic or manual fire alarm telegraph apparatus, connected by the necessary wires with the headquarters of the city fire alarm telegraph, and such other place or places as the Fire Marshal may direct. The number and location of the boxes and the character of the system, whether automatic or manual, or both, shall be determined by the Fire Marshal.

**Sec. 530. (Firemen.—Employment Of.—Duties.)**—It shall be the duty of every person or corporation conducting, maintaining or operating a theater, to employ one competent, experienced fireman, who shall be detailed by the Fire Marshal from the regular City Fire Department; shall be in the uniform of the Chicago Fire Department; shall be on duty at such theater during the whole time it is open to the public; he shall report to and be subject to the orders of the Fire Marshal; and shall see that all fire apparatus required by this chapter is in its proper condition, ready for use; all exit doors unlocked during the whole time such theater is open to the public and all in efficient and ready working order.

The compensation to be paid the city for the services of such city fireman so detailed and employed shall be based on the regular salary paid by the city to such fireman, and shall be computed according to the ratio between the number of hours such fireman is employed at such theater and the total number of hours such fireman is employed by the city for all purposes.

It shall also be the duty of every person or corporation conducting, maintaining or operating a theater, to employ, in addition to the fireman employed by such persons and detailed by the fire marshal, one other experienced and competent person as a private watchman or fireman, who shall be approved by the Fire Marshal; and who shall be in distinctive uniform; and shall be on duty at such theater during the whole time it is open to the public; such private watchman or fireman shall report and be subject to the orders of the Fire Marshal, and it shall be his duty to see that the provisions of this chapter are complied with in all portions of the theater occupied and used by the public; and that all exit doors are unlocked during the whole time such theater is open to the public and in efficient and ready working order. The city fireman and Fire Marshal shall require a drill of the employees of such theater, including such private watchman or fireman, in the use of all apparatus and appliances for the prevention of fire inside the building and the saving of life, at least twice in every week, and such city fireman shall report to the fire marshal the manner and efficiency of such drill. Such city fireman shall report in writing, daily, to the fire marshal the condition and equipment of the theater to which he is detailed. No city fireman shall be on duty at any one theater for a longer period than two (2) weeks.

**Sec. 531. (Amusement License.)**—The amusement license issued for each theater shall state the number of permanent seats the theater contains, which number shall be governed by the provisions of this ordinance relating thereto, and no more than that number of persons shall be permitted to be in such theater at any one time.

No license for the operation of a theater will be issued unless the Commissioner of Buildings, Fire Marshal and the City Electrician shall first have certified, in writing, that such theater complies with the provisions of this chapter in every respect.

**Sec. 532. (Lighting.—All Parts Well Lighted During Performances.)**—Every portion of any theater devoted to the use or accommodation of the public and all outlets therefrom leading to the streets, including all open courts, corridors, stairways, exits and emergency exit stairways, shall be well and properly lighted during every performance, and the same shall remain lighted until the entire audience has left the premises.

**Sec. 533. (Lights.—Control of Lights in Halls, Corridors and Lobbies.—Separate Shut-off.—Connections with Gas Mains.—Independent Connections.—Protection of Suspended and Bracket Lights.—Protection of Lights Inserted in Walls.—Protection of Footlights.—Construction of Border Lights.—Ducts and Shafts Conducting Heated Air from Lights.—Gas Stage Lights to Have Metal Screens.)**—All gas or electric lights in the halls, corridors, lobbies or any other part of any theater used by the audience, except the auditorium, shall be controlled by a separate shut-off, located in the lobby, and controlled only in that particular place. Gas mains supplying such theater shall have independent connections for the auditorium and the stage, and provision shall be made for shutting off the gas from the outside of the building. All suspended or bracket lights surrounded by glass in the auditorium, or in any other part of the theater, shall be provided with proper wire netting underneath. No gas or electric lights shall be inserted in the walls, woodwork, ceilings, or in any part of the theater, unless protected by fireproof materials. In case gas is used the footlights, in addition to the wire network, shall be protected by a strong wire guard not less than two feet distant from such footlights, and the trough containing such footlights shall be formed of and surrounded by fireproof material. All border lights shall be constructed according to the best known method, and subject to the approval of the Fire Marshal and the City Electrician, and shall be suspended by wire rope. All ducts and shafts used for conducting heated air from the main chandelier, or from any other light or lights, shall be constructed of metal and made double, with an air space between. All gas stage lights shall have strong metal wire guards or screens not less than ten inches in diameter, so constructed that any material coming in contact therewith shall be out of reach of the flames of such lights, and guards or screens shall be soldered to the fixtures in all cases.

The use of calcium lights in any theater is prohibited. All arc lights used on the stage shall at all times be subject to the approval of the city electrician, and no arc lights shall be used on any stage unless approved by said city electrician.

**Sec. 534. (Fire Apparatus.—Under Control of Fire Department.)**—The stand-pipes, automatic sprinklers, gas pipes, electric wires, hose, footlights, fire alarm boxes, fireproof proscenium curtain, switch boxes, ventilators, controlling levers, axes and pike poles, and all apparatus for the extinguishing of fire or guarding against the same, as provided for by this chapter, shall be made and kept at all times in condition satisfactory to and under the control of the Fire Marshal.

**Sec. 535. (Officers Empowered to Enter Buildings.)**—The Commissioner of Buildings, Fire Marshal, City Electrician, Superintendent of Police, or any of them, and their respective assistants, shall have the right to enter any buildings used wholly or in part for the purposes of Class V., and any and all parts thereof, at any reasonable time, and at any time when occupied by the public, in order to examine such buildings; to judge of the condition of the same and to discharge their respective duties, and it shall be unlawful for any person to interfere with them, or any of them, in the performance of their duties.

**Sec. 536. (The Commissioner of Buildings, Fire Marshal, City Electrician or Superintendent of Police Shall Close Buildings for Violations.)**—The Commissioner of Buildings, Fire Marshal, City Electrician and the Superintendent of Police, or any one of them, shall have the power and it shall be their joint and several duty, to order any building used wholly or in part for the purposes of Class V., closed, where it is discovered that there is any violation of any of the provisions of this chapter and keep same closed until such provisions are complied with.

**Sec. 537. (License.—Mayor Shall Revoke.)**—Upon a report to the Mayor by the Commissioner of Buildings, Fire Marshal, City Electrician or the Superintendent of Police that any requirement of this chapter, or that any order given by them or any of them in regard thereto has been violated, or not complied with, the Mayor shall revoke the license of any such theater or place of amusement so reported and cause the same to be closed.

#### **Buildings of Class V. Hereafter Erected.**

**Sec. 538.** The following provisions shall apply to buildings hereafter erected and used wholly or in part for the purposes of Class V.

Sec. 539. (Walls.—Outside Walls.—Structures Built Above.)—The outside walls of all such buildings, the roofs or ceilings of which are carried on trusses or girders of a span of fifty feet or more, shall be as follows:

If such walls are less than twenty-five feet high they shall not be less than twenty inches thick.

If they are more than twenty-five feet and less than forty-five feet high they shall be not less than twenty-four inches thick.

If they are more than forty-five feet and less than sixty feet high they shall be not less than twenty-eight inches thick.

If they are more than sixty feet and less than seventy-five feet high they shall be not less than thirty-two inches thick.

If they are more than seventy-five feet and less than ninety feet high, they shall be not less than thirty-six inches thick.

An increase of four inches in thickness of such walls shall be made in all cases where they are over one hundred feet long without cross walls of equal height.

The thickness of the enclosing or surrounding walls of rooms used for the purposes of Class V., where such rooms are less than fifty feet wide, may be reduced by four inches.

If one or more stories are built above any room devoted to the uses of Class V., and such stories are carried on trusses or girders, the thickness of walls shall be increased by four inches for each two stories or part thereof above such room.

If solid masonry buttresses are employed and placed eighteen feet or less apart, and extended to the foot of the trusses or girders carrying the ceiling, or if iron or steel columns are inserted in such walls for the support of the superstructure, and at distances not more than twenty-four feet between centers, and if such columns extend to and carry the superimposed trusses or girders, the thickness of such walls may be reduced in proportion to the increase of strength afforded by such buttresses or columns, but in no case shall any such wall be less than twelve inches thick in the top story, and four inches shall be added, going downward, for each story, for each gallery, or for each twenty-five feet in height of wall.

Sec. 540. (Columns in Walls.)—If iron or steel columns are introduced in such walls, the brickwork around such columns shall be bonded into the brickwork of the connecting wall, and each of such columns shall be fireproofed, as provided in Section 912 of this chapter.

Walls Around Stairs, Elevators and Shafts.—See Section 998.

Sec. 541. (Construction.—Frontage.—Open Spaces and Enclosed Passages.)—All buildings hereafter erected and used wholly or in part for the purposes of Class V. shall be built entirely of fireproof construction and shall be located so that they adjoin at least two public thoroughfares, one of which shall be a public street, and the other may be a public alley not less than ten (10) feet in width.

All floors, balconies and galleries of the audience room of every theater shall have open spaces or fireproof passageways on the three sides other than the proscenium; and on each of the two opposite sides other than the back and proscenium of every stage there shall be open spaces or fireproof passageways, and such open spaces or fireproof passageways shall open on or connect directly with the public thoroughfare.

All open spaces shall not be less than ten (10) feet in width and all fireproof passageways shall not be less than eight (8) feet in width, and shall be outside of the audience room, and shall be kept and maintained free and clear of obstruction of any and all kinds at any and all times.

All open spaces shall be open and unobstructed from the floor or pavement of such space to the sky, with the exception that emergency stairs and emergency balconies may be built in such open spaces. The entire floor of every open space shall be level or inclined; the incline shall not exceed two (2) inches in height for each one foot of horizontal measurement.

If one or more fireproof passageways are required on one side of the stage, then the fireproof passageways of each floor and the balcony and each gallery of the audience room shall be continued through the stage house as fireproof passageways to an open space or public thoroughfare, and from the end of each such fireproof passageway there shall be doors or stairs, or both, which shall be arranged so as to afford a safe exit for the audience of such theater to the pavement of the public thoroughfares, and if fireproof passageways are required on both sides of the stage, then they shall be arranged and connected with all of the fireproof passageways on both sides of the audience room in the same manner as described for fireproof passageways when these are required only on one side of the stage.

The fireproof passageways for the main floor may pass under the stage floor.

Provided, however, that where there is no public thoroughfare or open space at the back of the stage and on one side of the stage, then the fireproof passageways

for the main floor shall be on the stage floor and shall be built along that side of the stage on which there is no public thoroughfare and across the back of the stage to one of the public thoroughfares, and the fireproof passageways for the balcony and the fireproof passageways for the galleries shall each be built along the side of the stage and across the back of the stage, in a continuation of the balcony and gallery floor level to a public thoroughfare.

The fireproof passageways of the different floors, of the balcony and of the galleries, shall be independent of each other and shall not be connected with each other in any manner.

No doors or other openings except entrance doors from the audience room or exit doors to a thoroughfare shall be in the walls of a fireproof passageway; and all such doors shall be so arranged that when open they shall not obstruct the passage.

The walls of a fireproof passageway shall be not less than four (4) inches thick, and each and every part of such passageway, including each and all of its supports, shall be built of fireproof construction as required in the General Provisions relating to fireproof construction of this chapter.

Radiators for warming passageways shall be in recesses.

There shall be no steps or risers in a fireproof passageway, but where necessary inclined floors of the full width of the fireproof passageways may be built; the incline of the floor shall not exceed two and one-half ( $2\frac{1}{2}$ ) inches in height per foot, measured horizontally, and no such incline shall be less than ten (10) feet in length. No fireproof passageway shall be less than eight (8) feet high in any part thereof, except at doors, and these shall not be less than seven (7) feet high.

If the principal entrance corridor of a theater is at one side of the audience room, then the center line extended of such principal entrance shall intersect the center axis of the stage and the audience room between the back of the seat most remote from the stage on said center axis of the stage and the audience room, and a point midway between such seat and the wall opposite the proscenium wall.

**Sec. 542. (Construction.)**—All such buildings shall be built entirely of fireproof construction.

**Sec. 543. (Buildings of Other Classes Built in Conjunction With Class V.—Construction of.)**—If buildings used wholly or in part for purposes of Class V. are built in conjunction with or as part of buildings devoted to the uses of other classes, then such buildings of other classes shall be built entirely of fireproof construction.

**Sec. 544. (Floor Levels.—Limitation Of.)**—In all cases where the floors of the auditorium of any theater in any such building of Class V. are banked or stepped up, the floor level of the lowest bank shall not be above the sidewalk level.

All floors shall be designed and constructed in such manner as to be capable of bearing in all their parts, in addition to the weight of floor construction, permanent fixtures and mechanisms that may be set upon the same, a live load of one hundred pounds for every square foot of surface in such floors.

The audience room or rooms or auditorium or auditoriums used for the purposes of Class V. containing, in the aggregate, not more than five hundred seats, if in a fireproof building, may be located in any story thereof, but in such case there shall be at least two separate stairways from the floor or floors in which such audience room or auditorium is located to the ground, each of which stairways shall be not less than four feet in width in the clear.

**Sec. 545. (Stairways.—Entrances and Exits.)**—Stairways affording ingress to or egress from any room used for the purposes of Class V. shall be in width equivalent to twenty inches for every one hundred of seating capacity of such room, and for fractional parts of one hundred a proportionate part of twenty inches of width shall be added, but in no event shall any such stairway be less than four feet wide in the clear, except as hereinafter provided.

All such stairways shall have hand railings on each side thereof, and shall not ascend a greater height than thirteen feet six inches without a level landing, and the length and width of such landing shall be not less than the width of the stairs; no run of stairs shall consist of less than six risers between platforms, and risers shall not be placed on return platforms. Stairways which are over seven feet wide shall have double intermediate handrails with end newel posts at least five and a half feet high.

Steps shall not have a greater rise than seven and three-eighths inches, treads shall not be narrower than eleven inches, and winders shall not be used on any staircase.

Each and every balcony and gallery shall have separate and distinct entrances and stairways from the sidewalk level. The bottom run of the stairs shall be directly toward the street. Such stairs may ascend from the vestibule or entrance inside of

the building, but the bottom riser of such stairs shall be not more than sixty-five feet from the building line. All doors between such stairs and the street shall be kept unlocked and unfastened during each and every performance and until the audience has left the building.

There shall be an iron stairway or stairways from the stage to the fly gallery and gridiron, continuing to the roof of the building or to some fireproof passageway or exit. Such stairways may be circular. Such circular stairways, however, shall not be used for access to the dressing rooms.

Stairs leading to a box or boxes seating not to exceed thirty people in the aggregate shall be independent of all other stairs and seats, and not less than two feet eight inches wide in the clear. For each additional twenty-five of seating capacity or major portion thereof in such box or boxes there shall be an additional five inches in width of such stairway.

All stairways on the stage side of the proscenium wall shall be not less than two feet six inches wide.

**Sec. 546. (Floors at Exits.)**—Floors at all exits shall be so designed as to be level and flush with adjacent floors and shall extend for an unbroken width of not less than four feet in front of each exit, and shall be two feet wider than such exit.

**Sec. 547. (Seating.)**—More than ten seats in any one row between aisles shall not be lawful.

Seats shall be not less than twenty-two inches in width, measured at the top of the seat backs.

Rows of seats shall not be less than two feet ten inches from back to back.

No bank of seats shall have a greater rise than twenty-two inches.

All groups of seats shall be so arranged that there shall be an aisle at each side of each group, provided groups of five seats or less may abut upon a tunnel at one side and an aisle at the other side.

The number of banks of seats on the main floor shall not exceed fifteen, unless an intervening or cross aisle is provided between each fifteen banks of seats or a direct exit is provided for each aisle. The number of banks of seats in the "balcony" shall not exceed nine, unless an intervening or cross aisle is provided between each nine banks of seats or a direct exit is provided for each aisle.

**Sec. 548. (Tunnels.—Cross Aisles.—Vertical Rise.)**—There shall be no more than eleven feet rise, measured vertically, in any aisle in any gallery without a direct exit by tunnel or otherwise, to a corridor with free opening on to the gallery stairs or other direct discharge to the street, or at any such elevation of eleven feet an intervening or cross aisle leading directly to an exit. No tunnel shall be less than three feet wide in the clear.

**Sec. 549. (Foyer.)**—No foyer shall be open to the theater proper except through the exits.

**Sec. 550. (Main Floor.—Balcony and Gallery.—Designation Of.)**—The lower floor shall be designated the "Main floor."

Where there are balconies or galleries the first balcony or gallery shall be designated the "Balcony," and the second and third balcony or gallery shall be designated, respectively, "Gallery" and "Second Gallery." Such designation shall be printed plainly on all admission tickets.

**Sec. 551. (Aisles and Passageways.—Kept Unobstructed.)**—The minimum width of aisles with diverging sides in any room or auditorium used for the purposes of Class V, shall be two feet eight inches at the end near the stage, and not less than three feet at the other end.

The minimum width of aisles with parallel sides shall be three feet.

Every aisle shall lead directly to an exit.

**Sec. 552. (Steps in Aisles.)**—Steps shall not be permitted in aisles except as extending from bank to bank of seats, and no riser shall be more than seven and three-eighths inches in height, and no tread shall be less than ten inches in width, and whenever the rise from bank to bank of seats is less than five inches, the floor of the aisles shall be made as an inclined plane; and where steps are placed in outside aisles or corridors they shall not be isolated, but shall be grouped together, and a light shall be maintained so that every place where there are steps in enclosing aisles or corridors shall be clearly lighted.

**Sec. 553. (Aisles.—Passageways.—Corridors.—Exits.—To Be Kept Unobstructed.)**—All aisles, passageways, corridors and exits shall be kept free from camp stools, chairs, sofas and other obstructions, and no person shall be allowed to stand in or occupy any such aisles, passageways, corridors or exits during any performance, service, exhibition, lecture, concert or at any public assemblage.

**Sec. 554. (Corridors.—Passageways.—Hallways and Doors.—Width Of.)**—The width of corridors, passageways, hallways and doors shall be computed in the same manner as that hereinbefore provided for stairways, excepting, however, that no corridors shall be anywhere less than four feet in width and no doorway less than three feet wide, except as otherwise herein provided.

All corridors, passageways, hallways and stairways leading from any balcony or gallery to any toilet room, retiring room, smoking room, cloak room, check room or private office shall permit of free passage, without returning, to an outer exit of the building. Such corridors, passageways, hallways and stairways shall be at least three feet in width in every part between such balcony or gallery and such outer exit, and shall be unobstructed in every part, except by doors not less than three feet in width in the clear, which shall swing outward and which shall not be provided with locks or catches of any kind whatever.

**Sec. 555. (Doors.—Entrance.)**—The entrance doors to every theater shall be of sufficient width to accommodate the entire audience, computed on the basis of twenty inches of width in the clear to each one hundred permanent seats or proportionate part thereof in the audience room or auditorium of such theater, and all doors shall be so arranged that when open they shall not obstruct any corridor or passage whatsoever into which they open.

No mirrors shall be so arranged as to give the appearance of a doorway, exit, hallway or corridor, when no such doorway, exit, hallway or corridor is really in existence, nor shall there be any false doors or windows giving the appearance of an opening where none really exists.

**Sec. 556. (Emergency Exits Width.—Emergency Stairs, Width.—Emergency Exits Inside Walls of Buildings.—Fire Escapes, Construction.—Fire Escapes Leading to Street or Alley.—Doors Open Outward.)**—Emergency exits and stairways shall be provided separately for each floor, balcony or gallery. They shall be of the same size as that provided for the main exits, and no emergency exit, doorway or stairway shall be less than three feet in width. Such emergency stairway shall be made of iron, steel or other incombustible material. Such emergency exit shall be kept free of obstructions of any kind, including snow and ice.

Such emergency exits and stairways may be built inside the walls of the building, provided they are surrounded by a fireproof partition not less than four inches thick, separating the exits and stairways from the audience room or auditorium.

If such emergency exits lead outside the building, the openings leading thereto shall have metal door frames and metal doors with panels filled with fire-resisting glass, opening outward, hung from the inside corner of the jambs, and so constructed as not to project when opened beyond the outside face of the wall, and outer shutters shall not be permitted.

Whenever any such emergency stairway passes over an exit or door or window or other opening, such stairway shall be completely enclosed for a space of five feet greater in width than such opening, by iron, steel or other incombustible material.

All such emergency exits and stairways shall land at the ground level in a public thoroughfare or in some space that connects directly with a street or alley, and direct and immediate exit to such public thoroughfare shall not be obstructed by any door, gate, bars or other obstruction of any character.

Every court in which there is an emergency stairway shall have direct and unobstructed access along the surface of the ground to a street, alley or yard opening into an alley or street without entering into or passing through or over any building unless by a four-foot wide fireproof passage on the court or ground level.

All doors in openings from emergency exits and stairways shall be so constructed that when opened they will not obstruct any portion of any other doorway, opening or passageway.

All doors affording ingress to or egress from any theater shall open outward upon suitable hinges.

Exit doors shall not be obscured by draperies and shall not be locked or fastened in any manner during the entire time such theater is open to the public, so as to prevent them from being easily opened outwardly; and such doors shall be so constructed and maintained as to require no special knowledge or effort to open them from the interior.

**Sec. 557. (Wall.—Brick.—Proscenium Between Auditorium and Stage.—Steel Curtain Fireproofed on Stage Side.—No Combustible Material on Audience Side.—Plans for Curtain.—Permit from Building Department.—Inspection Fee.)**—There shall be a solid brick wall of the same construction and thickness as is required in the outside walls of the building in which such theater is located between the auditorium and the stage.

The main proscenium opening shall have a vertically operated steel curtain which shall, when it is lowered, completely close such proscenium opening. The curtain shall be raised and lowered by mechanical power, other than hand power, as the regular curtain and act drop each and every time there is an audience in the theater.

The lowering of the curtain shall be controlled from not less than two points in the building, one of which shall be designated by the Commissioner of Buildings.

The curtain shall have a steel covering on the outer (or auditorium) side. The stage side covering shall be of a non-conducting substance of such a thickness and such material as shall stand a test of two thousand degrees F. on the stage side for fifteen minutes and without heating the opposite side to a higher temperature than three hundred and fifty degrees F.

All metal work with the exception of the frame shall be covered with the non-conducting substance on the stage side.

The curtain shall operate vertically in steel guides of such a cross section that the edges shall engage and secure the edges of the curtain and prevent the curtain from leaving the guiding channel or channels if the curtain should tend to buckle or bag either inward or outward. No metal in the guide channels or in the engaging edge of the curtain shall be less than three-eighths ( $\frac{3}{8}$ ) of an inch thick. The joints of the curtain with the proscenium wall, with the stage floor and with the head of the opening shall be made gas tight as nearly as practicable.

The calculations for the strength of the curtain, the curtain guides and the guide anchors, and the workmanship shall be according to the best modern engineering practice, the stresses in the material and in the various sections of steel shall be within the safe limits of stress described in this ordinance.

No part of a curtain or of the curtain guides shall be supported by or fastened to any combustible material.

The supports of the curtain and the curtain guides and edges and the curtain shall be of sufficient strength to safely resist a pressure of twenty (20) pounds for each and every square foot of the curtain either inward or outward, if such curtain does or does not bag.

No combustible material other than painted decorations shall be applied to the audience side of any such curtain.

Plans for every such curtain shall be approved by the Building Department and a permit obtained for its erection. The Building Department shall inspect such curtain semi-annually, and for each such inspection a fee of two (2) dollars shall be charged.

All other openings in such proscenium wall shall have self-closing, regulation standard iron fire doors and iron frames and thresholds; such doors and frames shall be built in such a manner as to resist warping.

**Sec. 558. (Stage, Construction of.—Fireproof Paint.—Scenery.—How Treated.)—**The framing of the floor of every stage shall be of iron or steel or fireproof material. The stage floor may be of wood, but shall not be less than two and three-fourths inches thick. The entire floor construction and floor of fly galleries, rigging lofts and paint galleries, all railings and supports and stanchions thereon, and all sheaves, pulleys and cables and their supports shall be of iron or steel. All woodwork, including the under side of floor boards, and all framing for scenery used on or about the stage shall be coated with a fireproof paint, the qualities of which shall be submitted to and approved by the Commissioner of Buildings. All wood used for floor and floor supports shall be coated on the under side with the same kind of paint.

No scenery or stage paraphernalia of any sort shall be used on the stage of any room used for the purposes of Class V., unless such scenery and paraphernalia shall have been treated with a paint or chemical solution which shall make it non-inflammable, and which treated scenery or stage paraphernalia, or both, shall be tested and approved by the Fire Marshal.

**Sec. 559. (Vestibules for Stage Doors.)—**All doorways or openings in the rear or sides of the stage shall be vestibuled or protected in a manner satisfactory to the Commissioner of Buildings, so as to protect the curtain, scenery and auditorium against draughts of air.

**Sec. 560. (Structures Over Ceiling.—Construction.)—**If any structure is built over the ceiling or roof of any theater, the different members of the girders or trusses supporting same shall have their fireproofing double, in the manner prescribed for columns of fireproof buildings as specified in the General Provisions of this chapter.

**Sec. 561. (Vents, Size Of.—Flue Pipes.—Dampers.—Switches for Dampers.)—**One or more vents or flue pipes of metal construction, or other incombustible material, suitable for carrying away smoke, and approved by the Commissioner of Buildings, and extending not less than fifteen feet above the highest point of the roof,

and equivalent in area to one-twentieth of the area of the stage, shall be built over the stage.

In buildings where additional stories are built above the stage, such vents or flue pipes may be carried out near the top of the stage walls, and shall be continued and run up on the exterior of the buildings to a point five feet above the highest point of such additional story.

All such flues or vents shall be provided with metal dampers, and shall be opened by a closed circuit battery, approved by the City Electrician.

Such dampers shall be controlled by two switches, one at the electrician's station on the stage, which station shall be fireproof, and the other at the city fireman's station, on the opposite side of the stage; such switches shall be located in such places on the stage as are designated by the Fire Marshal, and each shall have a sign with plain directions as to the operation of the same printed thereon.

All fuse boxes shall be surrounded by two thicknesses of fireproof material, with an air space between, and no fuses shall be exposed to the air between the switchboards.

**Sec. 562. (Automatic Sprinklers.—Location.—Tank.—Connections.)**—There shall be provided an approved system of automatic sprinklers with approved automatic closed circuit electric devices connecting the valves, regulating the flow of water into the various sprinkler pipes with the headquarters of the city fire alarm telegraph, and such other place or places as the Fire Marshal shall direct, so arranged as to prevent any tampering with the system or the shutting off of the water from the sprinkler pipes without automatic notice to the fire department.

Such system of automatic sprinklers shall be supplied with water from a tank located not less than twenty feet above the level of the highest sprinkler head in the system, and it shall be the duty of the firemen provided for in this chapter to include in their daily report the result of an inspection to determine the sufficiency of water in this tank. Automatic sprinklers shall be placed in the paint room, store room, property room, scene storage room, carpenter shop and dressing rooms, if such rooms are in or connected with a building used for the purposes of Class V. Such tank shall not be connected with a standpipe and ladder system, but it shall be filled through a separate pipe from a fire pump, and a three-inch iron pipe shall extend from such tank to the outside of such building with Siamese connections for fire department use. Such entire automatic sprinkler system and equipment and the location thereof shall be subject to the approval of the Fire Marshal.

**Sec. 563. (Fire Apparatus on Stage.—Hand Fire Pumps.—Fire Materials.—Hot Air Furnaces.)**—A standpipe not less than three inches in diameter, having a hose valve or valves thereon shall be installed on each side of the stage with a hose connection at the stage and at each level above and below the stage, and hose connected thereto at each valve ready for use at all times. Such standpipes shall be connected with a tank on the roof containing not less than three thousand gallons of water, protected from frost, and such tank shall be connected with and supplied by a power pump, all of which shall be subject to the approval of the Fire Marshal. Portable fire extinguishers or hand fire pumps shall always be kept ready for use on and under the stage, in fly galleries and in rigging loft, and in addition thereto at least four fire department axes and six pike poles shall be kept ready for use on each tier or floor of the stage, all of which shall be subject to the approval of the Fire Marshal.

The use of ordinary hot air furnaces or stoves is prohibited.

**Sec. 564. (Exits.—Diagram of.—Printed on Programs.)**—It shall be the duty of the owner, lessee or manager of any theater, for any performance in which programs are issued, to cause to be printed on such programs on the page opposite that on which the cast is printed, a diagram showing conspicuously all exits of such building. A diagram of seats on each floor, and the exits leading from each floor, drawn to a scale of one-eighth inch to the foot, shall be hung in a frame within two feet of the ticket seller's window and so as to be easily seen by the public.

**Sec. 565. (Independent Lighting System for Exits.—Red Light Over Exits.)**—All stairways and corridors shall be supplied with a supplementary lighting system of electricity, gas or sperm oil, and such system shall be independent of all other lights in such building, and shall be in operation during the entire period such theater is open to the public and until the audience has left the building. The word "EXIT" shall be in letters at least six inches high over the opening to every means of egress from such theater and a red light, furnished by gas or sperm oil, shall be kept burning over such word "EXIT" at every such opening, during the entire period such theater is open to the public and until the audience has left the building.

**Sec. 566. (Fire Alarm Apparatus.)**—Every theater shall be provided with an approved system of automatic or manual fire alarm telegraph apparatus, connected by

562 to 566—375 to 379

the necessary wires with the headquarters of the city fire alarm telegraph and such other place or places as the Fire Marshal shall direct. The number and location of the boxes and the character of the system, whether automatic or manual or both, shall be determined by the Fire Marshal.

**Sec. 567. (Firemen.—Employment of.—Duties of.)**—It shall be the duty of every person, or corporation, conducting, maintaining or operating a theater, to employ one competent, experienced fireman, who shall be detailed by the Fire Marshal from the regular City Fire Department; shall be in the uniform of the Chicago Fire Department; shall be on duty at such theater during the whole time it is open to the public; shall report to and be subject to the orders of the Fire Marshal; shall see that all fire apparatus required by this chapter is in its proper condition, ready for use; all exit doors unlocked during the whole time such theater is open to the public, and all in efficient and ready working order.

The compensation to be paid the city for the services of such city fireman so detailed and employed shall be based upon the regular salary paid by the city to such fireman and shall be computed according to the ratio between the number of hours such fireman is employed at such theater and the total number of hours such fireman is employed by the city for all purposes.

It shall also be the duty of every person or corporation conducting, maintaining or operating a theater, to employ, in addition to the fireman employed by such persons and detailed by the Fire Marshal, one other experienced and competent person as a private watchman or fireman, who shall be approved by the Fire Marshal; shall be in a distinctive uniform; shall be on duty at such theater during the whole time it is open to the public; shall report to and be subject to the orders of the Fire Marshal, and whose duty it shall be to see that the provisions of this chapter are complied with in all portions of the theater occupied and used by the public; shall see that all exit doors are unlocked during the whole time such theater is open to the public, and in efficient and ready working order. The city fireman and Fire Marshal shall require a drill of the employes of such theater, including such private watchman or fireman, in the use of all apparatus and appliances for the prevention of fire inside the building and the saving of life, at least twice in every week, and such city fireman shall report to the Fire Marshal the manner and efficiency of such drill. Such city fireman shall report in writing, daily, to the Fire Marshal the condition and equipment of the theater to which he is detailed. No city fireman shall be on duty at one theater for a longer period than two (2) weeks.

**Sec. 568. (Amusement License.)**—The amusement license issued for each theater shall state the number of permanent seats it contains, which number shall be governed by the provisions of this chapter relating thereto, and no more than that number of persons shall be permitted in such theater at any one time.

No license for the operation of a theater shall be issued unless the Commissioner of Buildings, Fire Marshal and City Electrician shall first have certified, in writing, that such theater complies with the provisions of this chapter in every respect.

**Sec. 569. (Lighting.—All Parts Well Lighted During Performances.)**—Every portion of any theater, devoted to the uses or accommodation of the public, and all outlets therefrom, to the streets, including open courts, corridors, stairways, exits and emergency exit stairways, shall be well and properly lighted during every performance, and the same shall remain lighted until the entire audience has left the premises.

**Sec. 570. (Lights.—Control of Lights in Halls, Corridors and Lobbies.—Separate Shut-off.—Connections With Gas Mains.—Independent Connections.—Protection of Suspended and Bracket Lights.—Protection of Lights Inserted in Walls.—Protection of Footlights.—Construction of Border Lights.—Ducts and Shafts Conducting Heated Air from Lights.—Gas Stage Lights to Have Metal Screens.)**—All gas or electric lights in the halls, corridors, lobbies or any other part of any theater used by the audience, except the auditorium, shall be controlled by a separate shut-off located in the lobby and controlled only in that particular place. Gas mains supplying such theater shall have independent connections for the auditorium and the stage and provision shall be made for shutting off the gas from the outside of the building. All suspended or bracket lights surrounded by glass, in the auditorium, or in any other part of the theater, shall be provided with proper wire netting underneath. No gas or electric lights shall be inserted in the walls, woodwork, ceiling, or in any part of the theater unless protected by fireproof materials. In case gas is used, for the footlights, in addition to the wire network, they shall be protected by a strong wire guard, not less than two feet distant from such footlights, and the trough containing such footlights shall be formed of and surrounded by fireproof material. All border lights shall be constructed according to the best known methods, and subject to the approval of the Fire Marshal and the City Electrician, and shall be suspended by wire

ropes. All ducts and shafts used for conducting heated air from the main chandelier, or from any other light or lights, shall be constructed of metal and made double, with an air space between. All gas stage lights shall have strong wire metal guards or screens, not less than ten inches in diameter, so constructed that any material coming in contact therewith shall be out of reach of the flames of such lights, and shall be soldered to the fixtures in all cases.

The use of calcium lights in any theater is prohibited. All arc lights used on the stage shall be at all times subject to the approval of the City Electrician, and no arc lights shall be used on any stage unless approved by the City Electrician.

Sec. 571. (Fire Apparatus to Be Under Control of Fire Department.)—The standpipes, automatic sprinklers, gaspipes, electric wires, hose, footlights, fire alarm boxes, fireproof proscenium curtains, switch boxes, ventilators, controlling levers, axes and pike poles, and all apparatus for the extinguishing of fire or guarding against same, as provided for by this chapter, shall be made and kept at all times in condition satisfactory to and under control of the Fire Marshal.

Sec. 572. (Officers Empowered to Enter Buildings.)—The Commissioner of Buildings, Fire Marshal, City Electrician, Superintendent of Police, or any of them, and their respective assistants, shall have the right to enter any buildings used wholly or in part for the purposes of Class V., and any and all parts thereof, at any reasonable time, and at any time when occupied by the public, in order to examine such buildings and to judge of the condition of the same and to discharge their respective duties, and it shall be unlawful for any person to interfere with them or any of them in the performance of their duties.

Sec. 573. (The Commissioner of Buildings, Fire Marshal, City Electrician or Superintendent of Police Shall Close Buildings for Violations.)—The Commissioner of Buildings, Fire Marshal, City Electrician or Superintendent of Police, or any of them, shall have the power and it shall be their joint and several duty to order any building used wholly or in part for the purposes of Class V. closed, where it is discovered that there is any violation of the provisions of this chapter, and to keep same closed until such provisions are complied with.

Sec. 574. (License.—Mayor Shall Revoke.)—Upon a report to the Mayor by the Commissioner of Buildings or Fire Marshal or City Electrician or the Superintendent of Police that any requirement of this chapter, or that any order given by them or any of them, in regard thereto, has been violated, or not complied with, the Mayor shall revoke the license of any such theater or place of public amusement so reported and cause the same to be closed.

ARTICLE IX.

PROVISIONS RELATING SOLELY TO CLASS VI.

Sec. 600. (Class VI.)—In Class VI. shall be included every tenement and apartment house; that is to say, any house or building, or portion thereof, which is used as a home or residence for two or more families living in separate apartments.

Sec. 601. (Walls of Class VI.—Thickness of.)—Buildings of Class VI. shall conform to the following requirements:

The thickness of enclosing walls of buildings of Class VI shall be made in accordance with the following table, to wit:

		STORIES											
	Basement.	1	2	3	4	5	6	7	8	9	10	11	12
Basement and .....	12	8											
Two-story .....	12	12	8										
Three-story .....	16	12	12	12									
Four-story .....	20	16	16	12	12								
Five-story .....	20	16	16	16	12	12							
Six-story .....	20	20	16	16	16	12	12						
Seven-story .....	24	24	20	20	16	16	12	12					
Eight-story .....	24	24	24	20	20	16	16	12	12				
Nine-story .....	28	24	24	20	20	20	16	16	12	12			
Ten-story .....	28	24	24	24	20	20	20	16	16	12	12		
Eleven-story .....	28	28	24	24	24	20	20	20	16	16	12	12	
Twelve-story .....	32	28	28	24	24	24	20	20	20	16	16	12	12

Provided, however, in buildings of steel skeleton fireproof construction, thickness of walls shall be governed by the provisions of Section 911 of this chapter.

Sec. 602. (**Definitions.**)—"New Tenement House" includes every tenement house hereafter in existence not now used as a tenement house, but hereafter converted or diminished in size or otherwise altered after its erection, and every building now or hereafter in existence not now used as a tenement house, but hereafter converted or altered to such use.

Sec. 603. (**Apartment.**)—"Apartment" is a room or suite of two or more rooms occupied or intended or designed to be occupied as a family domicile.

Sec. 604. (**Yard.**)—"Yard" is an open, unoccupied space on the same lot with a tenement house, separating every part of every building on the lot from the rear line of the lot.

Sec. 605. (**Court.**)—"Court" is an open, unoccupied space, other than a yard, on the same lot with a tenement house; a court entirely surrounded by a tenement house is an "inner court;" a court bounded on one side and both ends by a tenement house and on the remaining side by a lot line is a "lot line court;" a court extending to a street, alley or yard is an "outer court."

Sec. 606. (**Shaft.**)—"Shaft" includes exterior and interior shafts, whether for air, light, elevator, dumb waiter or any other purpose; a "vent shaft" is one used solely to ventilate or light a water closet compartment, bath room, or pantry.

Sec. 607. (**Public Hall.**)—"Public Hall" is a hall, corridor or passageway, not within an apartment.

Sec. 608. (**Stair Hall.**)—"Stair Hall" includes the stairs, stair landings, and those portions of the public halls through which it is necessary to pass in getting from the entrance floor to the top story.

Sec. 609. (**Basement.**)—"Basement" is a story partly, but not more than one-half—"Cellar" is a story more than one-half—below the level of the street grade nearest the building; where the grade of a street adjacent to a tenement house varies, the mean or average grade of such street opposite the lot containing the tenement house shall be regarded as the grade of such street within the meaning of this chapter.

Sec. 610. (**Story.**)—"Story" is that portion of a building between the top of any floor beams and the top of the floor or ceiling beams next above.

Sec. 611. (**Solid Masonry.**)—A good quality of brick, laid in lime mortar, of strength and character equal to the requirements of Section 996 of this chapter, for brick walls, shall be taken as the standard of strength and stability for "solid masonry," but any other fireproof materials of equal strength and stability to the above standard may be substituted for brick.

Sec. 612. (**Construction of.**)—Every new tenement house more than five stories and basement high shall be of fireproof construction (according to the definition of "fireproof construction" contained in Section 901 of this chapter); every new tenement house more than three stories and basement high, but not more than five stories and basement high, shall be of slow-burning or fireproof construction (according to the definition of "slow-burning or fireproof construction" as defined in this chapter). In case slow-burning construction be used the cellar and basement construction, including the floor construction of the first story above the cellar or basement, shall be of fireproof construction.

Sec. 613. (**Partitions Between Apartments in Frame Buildings to Be Incombustible.**)—In all new frame tenement houses outside the fire limits of the city, each suite of apartments shall be separated from the next suite in such building by a wall of incombustible material of such character as the Commissioner of Buildings may require.

Sec. 614. (**Joists.—Supports for.**)—If in buildings of Class VI. the distance between the enclosing walls is more than twenty-four feet in the clear, there shall be intermediate supports for the joists, which supports shall be either brick walls or iron or steel. If brick walls are used for this purpose they may, in all cases where the thickness of walls is given in the table as 16 inches or more, be made 4 inches less in thickness than the dimensions stated in the table.

**Walls.—Ledges in.**—See Section 997.

Sec. 615. (**Fire Escapes.**)—Every tenement house four or more stories in height shall be provided with a fire escape or fire escapes, such as are required by the statutes of this state and the ordinances of the city. In every case each separate apartment shall have direct access to at least one such fire escape unless such apartment shall have direct access (without passing through any other apartment) to at least two separate flights of stairs leading to the ground, one of which is placed in front and one in the rear of such building, and one of which may be placed outside of the building; but where such separate apartment shall not have access

to two such flights of stairs, then there shall be a metal stairway between the balconies of every such fire escape, securely fastened to the walls of the building not less than two feet wide, with a proper hand rail, instead of the usual vertical ladder. Every court in which there shall be a fire escape shall have direct and unobstructed access along the surface of the ground to a street, alley, or yard opening into the alley or street, without entering into or passing through or over any building, unless by a four-foot wide fireproof passage on the court or ground level.

**Sec. 616. (Fire Escapes to Be Painted.)**—Every new fire escape shall be painted with two coats of durable paint, one put on in the shop and the other at once upon the erection of such fire escape.

**Sec. 617. (Bulkheads and Scuttles.—Stairs to.)**—Every tenement house shall have in the roof a bulkhead or scuttle, fireproof or covered with fireproof materials, with stairs or ladder leading thereto; no such roof opening shall be less than two feet by three feet. No scuttle or bulkhead door shall have upon it any lock, but may be fastened on the inside by movable bolts or hooks.

**Sec. 618. (Stairs and Halls.—In Case of Alterations.—Requirements.)**—Every now existing and every new tenement house shall have at least two flights of stairs, which shall extend from the entrance floor to the top story. Such stairs and the public halls in every tenement house shall each be at least three feet wide in the clear, and every apartment shall be directly accessible from both such flights of stairs. If any existing tenement house be so altered as to increase the number of apartments therein, or if such building be increased in height, or if the halls and stairs therein be damaged by fire or otherwise to an extent greater than one-half the original cost thereof, the entrance, stair halls, entrance halls and other public halls of the whole building shall be made to conform to the requirements of this ordinance as to new tenement houses.

**Sec. 619. (Railings and Guards.)**—In every tenement house all stairways shall be provided with sufficient railings and guards.

**Sec. 620. (Stairs in Non-Fireproof Buildings, Eighty to One Hundred and Twenty Rooms.)**—Every new non-fireproof tenement house containing over eighty rooms, exclusive of bath rooms, shall have one additional flight of stairs (over and above the flights hereinbefore provided for) for every additional eighty rooms, or fraction thereof; but if such building contains not more than one hundred and twenty rooms, exclusive of bath rooms, at the owner's option, in lieu of an additional stairway, the stairs and public halls throughout the entire building shall be at least one-half wider than is provided in Sections 618 and 625 of this chapter.

**Sec. 621. (Stairs in Fireproof Buildings One Hundred and Twenty Rooms and Upward.)**—Every new fireproof tenement house containing over one hundred and twenty rooms, exclusive of bath rooms, shall have one additional flight of stairs (over and above the flights hereinbefore provided for) for every additional one hundred and twenty rooms or fraction thereof; but if such building contains not more than one hundred and eighty rooms, exclusive of bath rooms, at the owner's option, in lieu of an additional stairway, the stairs and public halls throughout the entire building shall be made at least one-half wider than is provided in Sections 618 and 625 of this chapter.

**Sec. 622. (Stairs.—Entrance to.—Treads and Risers.)**—Every flight of stairs required in a tenement house shall have an entrance on the entrance floor from a street or alley, or from a yard or court which opens into a street or alley. All stairs except rear stairs, in new tenement houses, shall have risers not more than seven and three-quarters inches high and treads not less than nine and one-half inches wide exclusive of nosings, except in winding stairs, where all treads at a point eighteen inches from the strings on the well side shall be at least nine and one-half inches wide, exclusive of nosings.

**Sec. 623. (Stairs and Stair Halls.—Over Three Stories.—Fire-Resisting Glass.)**—The stairs and stair halls in all new tenement houses more than three stories and basement high shall be constructed of incombustible material throughout, except that the treads of stairs (not less than one and three-fourths inches thick) and all hand rails, may be of hard wood. All windows in stair halls in new tenement houses more than three stories and basement high opening on inner courts or shafts shall be of good quality fire-resisting glass.

**Sec. 624. (Stair Halls Enclosed in Masonry.—Requirements.—Exceptions.)**—In every new non-fireproof tenement house all stair halls shall be inclosed on all sides with walls of solid masonry of the same dimensions and thickness as specified for enclosing walls. All glass in such stair halls shall be of good quality fire-resisting glass, except where same opens into a street, alley, outer court or yard. There shall be no movable transoms or sash openings from any such stair hall to any other

part of the building. This section shall not apply to tenement houses which are not more than three stories and basement high, with only one apartment on each floor.

**Sec. 625. (Entrance Halls.—Solid Masonry.—Exceptions.—Ceilings.)**—Every main entrance hall in a new tenement house shall be at least three feet six inches wide in the clear from the entrance up to and including the stair enclosure, and beyond this point at least three feet wide in the clear. In every new non-fireproof tenement house, except where there is only one apartment on each floor, such entrance hall shall be inclosed with solid masonry walls and with ceilings covered with incombustible material and shall comply with all the conditions of the preceding sections of this chapter as to the construction of stair halls. If such main entrance hall is the only entrance to more than one flight of stairs, the several portions of such main entrance hall which separate the entrance of the building from the several flights of stairs respectively shall be increased respectively at least one foot in width for each additional flight of stairs.

**Sec. 626. (Frame Building Not to Be Enlarged.)**—No wooden frame tenement house within the fire limits shall be enlarged either by adding to its height or to its superficial area.

**Sec. 627. (Bay Windows.—Vent Shafts.—Openings.)**—All bay windows and all shafts and courts in new tenement houses shall have their walls of brick or other fireproof construction throughout. All openings in vent shafts as well as in shafts for light or ventilation, shall either have fireproof closing doors or else shall be glazed with fire-resisting glass; provided, however, that the above provisions of this section shall not apply to enclosures about elevators or in a well hole of stairs where the stairs themselves are enclosed in brick or stone walls and are constructed entirely of fireproof materials.

**Sec. 628. (Apartments Divided by Masonry.)**—There shall be a wall of solid masonry of the same thickness as required for outside walls in buildings of this character, extending from the ground to the roof between each set of apartments and around each well hole, court or light shaft; provided, however, that the wall between apartments above the first story extending from a main stair hall to the outer wall of the building may jog or set over to some point toward the center of the building to provide or allow for an even distribution of space of the rooms adjacent to the same; provided, however, that such wall above the first story, if supported on iron or steel beams (which shall extend from the brick wall surrounding the main stair hall to the outer wall of the building at each succeeding story), shall be not less than eight inches in thickness, but all brick walls between apartments and around each well hole, court or light shaft which extend from the ground to the roof and above the first story of an apartment building not supported as above described in this section, shall be of the thickness prescribed for buildings of this class in Section 601 of this chapter.

**Sec. 629. (Space Occupied on Lot.—Plat Measurements.)**—No new tenement house, alone or with other buildings now or hereafter erected, shall occupy above the first story more than eighty-five per centum of the area of a corner lot or more than ninety per centum of the area of such corner lot, if such corner lot is bounded on three sides by streets or alleys, or more than seventy-five per centum of the area of any other lot, provided, that the space occupied by fire escapes, constructed and erected according to law and not more than four feet wide, shall be deemed unoccupied.

At the time of applying for a permit for the erection of a new tenement house the applicant shall submit a plat of the lot showing the dimensions of the same and the position to be occupied by the proposed building, and the position of any other building or buildings that may be on the lot. The measurements shall in all cases be taken at the top of the first story and shall not include any portion of any street or alley.

**Sec. 630. (Corner Lot Defined.—Frontages.—Triangular Lots.)**—By corner lot is meant a lot situated at the junction of two streets or of a street and public alley not less than sixteen feet in width. Any portion of the width of such lot distant more than fifty feet from such junction shall not be regarded as part of a corner lot, but shall be subject to the provisions of this chapter respecting other than corner lots.

Where, in corner lots, the two frontages are of unequal length, the lesser street frontage shall be taken as the width of the lot. Street frontage alone and not alley frontage shall be considered in determining such lesser frontage. No existing tenement house shall hereafter be enlarged or its lot be diminished or other buildings be placed on its lot, so that after such change a larger proportion of any corner lot

or other lot upon which it is situated is covered by buildings than the aforesaid proportions, respectively; provided, however, that in case of a lot triangular or irregular in shape, bounded on two or more sides by a street and having a number of lineal feet street frontage extending one-twentieth of the number of square feet in the area of such lot, it shall not be necessary to comply with the conditions of this section as to percentage of lot to be covered; and provided, further, that there shall be no violation of Section 634 of this chapter in the erection of any tenement house.

**Sec. 631. (Fire Walls.—When Dispensed With.)**—Fire walls of brick not less than twelve inches thick shall be built, extending above the roofs of all adjoining buildings, if such roofs are flat, and also where the building stands upon any line of any lot, excepting street or alley lines. Provided, that where eight-inch walls are permitted in the top story of buildings, or where the building is not over three stories high, the fire walls may be eight inches thick. Such fire walls, where they stand upon lot lines or where they are over the dividing walls between buildings or over the dividing walls in the interiors of buildings, where such are called for by this chapter by reason of the great area of such buildings, shall extend at least two feet above the roofs of such buildings. Fire walls upon street and alley lines shall extend not less than eighteen inches above the roofs of such buildings. Fire walls may be dispensed with on street and alley lines, if the top of the roof boards and roof joists are protected against fire for a distance of at least five feet from such street or alley lines by a coating of mortar or hollow tile or porous tile at least two inches thick. Fire walls at street and alley lines may also be dispensed with in all cases where the entire framing and material of the roof shall be made strictly fireproof.

Walls facing upon courts and light shafts shall be treated as in the same category with walls facing upon streets and alleys.

Fire walls shall be covered with a weatherproof coping of incombustible material.

**Sec. 632. (Height.—How Measured.)**—The height of a new tenement house shall not by more than one-half exceed the platted width of the widest street on which it abuts.

Provided, however, that any distance the building sets back from the lot line shall be added to the width of the street in making this computation, but no existing tenement house shall be increased beyond such height. Such height shall be the perpendicular distance from the grade nearest the house to the highest point of the roof (not including as part of the roof any cornice or bulkhead less than eight feet high, or any elevator enclosure less than sixteen feet high). Where such street grade varies, the mean or average grade thereof opposite such house shall be the datum from which such height shall be measured.

**Sec. 633. (Alley or Yard in Rear.—Must Have.—Size of Yard Increased.)**—At the rear of every lot containing a new tenement house (unless the rear of such lot abuts upon a public alley at least ten feet wide) there shall be a yard open and unobstructed from the earth to the sky, except by fire escapes not more than four feet wide, constructed and erected according to law; every part of such yard shall be directly accessible from every other part thereof; such yard shall on corner lots (as above defined) have an area of at least eight per centum of the superficial area of the lot, and shall on other lots have an area of at least ten per centum of the superficial area of the lot. Every such yard shall be increased one per centum of the superficial area of the lot for every story above three stories in the height of the tenement house situated thereon, and in no case shall such yard separate any building on such lot by less than ten feet from the rear line of the lot at the nearest point of approach of such building to such rear line.

*For the purpose of construing and enforcing this section, the rear of the lot shall be held and deemed to be that part of the lot that is farthest from the line of the street upon which the proposed building will face, and in case where the proposed building will stand upon a corner lot or tract of land abutting upon two streets and an alley, in all such cases the proposed building or buildings may extend from the front to the rear of such lot or tract. Nothing herein contained shall conflict with or modify any other provision of this ordinance. As amended by ordinance, January 8, 1906.*

*As amended by ordinance January 8, 1906, by addition of the part in italics.*

**Sec. 634. (Requirements in Case of Enlarging.—Distance Between Buildings.)**—No existing tenement house shall (unless the rear of the lot upon which it stands abuts upon a public alley at least ten feet wide) hereafter be enlarged or its lot be diminished so that any building on such lot shall at any point approach nearer than ten feet to the rear line of the lot. Where a tenement house, now or hereafter erected, stands upon a lot, other than a corner lot, no other building shall hereafter be placed upon the front or rear of that lot, unless the minimum distance between such buildings be at least ten feet, if neither building exceeds the height of one story; or fifteen

feet, if either building exceeds the height of one story, but not the height of two stories; and so on, five additional feet to be added to such minimum distance of ten feet for every story more than one in the height of the highest building on such lot.

**Sec. 635. (Courts.—Porches.)**—Every court of every new tenement house shall be open and unobstructed at every point thereof from the bottom thereof to the sky, save by fire escapes or stairs or landings constructed and erected according to law and projecting not more than four feet into courts, which courts shall communicate directly without obstruction into a street, alley or yard. Where porches are constructed in courts, the amount of area of unobstructed space in such courts shall be exclusive of space occupied by stairs and porches. No rear porch shall be constructed which is more than eight feet in width where the construction is of combustible material, and no such rear porches shall be enclosed with other than incombustible material, as defined in Section 907 of this chapter.

**Sec. 636. (Rooms.—Habitable.—Windows.—Vent Shafts.)**—In every new tenement house every habitable room, excepting water closet compartments and bath rooms, shall have at least one window opening directly upon a street, alley, yard or court. The total area of the windows opening from any such room (other than water closet compartments and bath rooms) upon a street, alley, yard or court, shall be at least one-tenth of the floor area of that room, and the top of at least one window shall be not less than seven feet above the floor and the upper half of that window shall be made so as to open its full width. No window in any such room (other than pantries, water closet compartments and bath rooms) shall have less than ten square feet glass area, and in no such water closet compartment or bath room shall the total window area be less than three square feet glass area, or the width of any window less than one foot; and when any window ventilating any water closet compartment or bath room in any new tenement house opens into a vent shaft, no window from any room other than a water closet compartment, bath room, pantry or hall shall open into such vent shaft.

**Sec. 637. (Windows in Lot Line Walls.)**—Windows in addition to those provided for in Section 639 of this chapter, if placed in any lot line wall or in any wall nearer to the lot line than is specified in Section 639 of this chapter from such lot line, then the sash in such window shall be stationary and glazed with fire-resisting glass.

**Sec. 638. (Courts.—Inner.—Sizes Of.—Lot Line Courts.)**—The inner courts of all new tenement houses as defined in Section 605 of this chapter shall have areas and minimum widths in all parts not less than the widths and areas as follows:

Buildings.	Square Feet.	Least Width.
2 stories.....	100	6 feet
3 stories.....	120	7 feet
4 stories.....	160	8 feet
5 stories.....	250	12 feet
6 stories.....	400	16 feet
7 stories.....	625	20 feet
8 stories.....	840	24 feet

"Lot line courts" shall have areas and minimum widths in all parts not less than one-half of those specified in the above table of "inner courts."

**Sec. 639. (Courts.—Outer.—Sizes Of.—Width Increased.)**—The "outer courts" of all tenement houses defined in Section 605 of this chapter shall have not less than the following widths for their minimum in all parts:

Buildings.	Least Width.
2 stories.....	3 feet
3 stories.....	3 feet 6 in.
4 stories.....	4 feet
5 stories.....	6 feet
6 stories.....	8 feet
7 stories.....	10 feet
8 stories.....	12 feet

If the outer or lot line court has windows on opposite sides of the same, the least widths given in the above table for outer courts shall be doubled.

**Sec. 640. (Rooms.—Sizes and Height Of.—Attic and Janitor's Rooms.)**—In every new tenement house, all rooms, except water closet compartments and bath rooms, shall be of the following minimum sizes: In each apartment there shall be at least one room containing not less than one hundred and twenty square feet of floor area, and every other room shall contain at least seventy square feet of floor area. Each room shall be in every part not less than eight feet six inches high from the finished

floor to the finished ceiling, but an attic room need be eight feet six inches high in but one-half of its area; provided, that in a basement apartment used for janitor's use only, such room or rooms shall be not less than eight feet high in the clear.

Sec. 641. (Rooms.—Changes in Existing.)—No room in any now existing tenement house shall hereafter be constructed, altered, converted or occupied for living purposes unless it contains a window having a superficial area not less than one-twelfth the floor area of the room, which window shall open upon a street or alley or upon a yard or court having a superficial area of not less than twenty-five square feet; or unless such room adjoins another room in the same apartment, which other room shall have such a window opening upon such a street, alley, yard or court, and between which two adjoining rooms there shall be a sash window having at least fifteen square feet of glazed surface, the upper half of which shall be so made as to open easily.

Sec. 642. (Windows.—Courts.—Attic.)—No room in any now existing tenement house which has no such window, as aforesaid, opening upon a street or alley or upon a yard or court having a superficial area of not less than twenty-five square feet, shall hereafter be constructed, altered, converted or occupied for living purposes, unless it contains a floor area of at least sixty square feet and also at least six hundred cubic feet of air space; nor unless every part of the finished ceiling of such room be at least eight feet distant from every part of the finished floor thereof; provided, that an attic room need be eight feet high in but one-half of its area and such attic room shall not be used for purposes of human habitation other than as a sleeping room.

Sec. 643. (Air.—Quantity of for Each Person.)—No room in any tenement house shall be so occupied that the allowance of air to each person living or sleeping in such room shall at any time be less than four hundred cubic feet for each such person more than twelve years old, and two hundred cubic feet for each such person of the age of twelve years or under.

Sec. 644. (Alcoves.)—Every alcove shall be deemed a separate room for all purposes within the meaning of this chapter except such an alcove as, adjoining another room, has at least twenty per centum of entire wall surface of alcove opening to another room.

Sec. 645. (Light in Halls.—Recesses.—Returns.—Doors In.)—In every new tenement house every public hall shall be lighted by at least one window in each story opening directly upon a street, alley, yard or court, or by a skylight. Such window shall be so placed that light may pass directly through it and the hall to the opposite end of the hall, or else there shall be at least one window opening directly upon a street, alley, yard or court in every twenty feet in length or fraction thereof of every such hall, except in so much of any entrance hall as lies between the entrance and the flight of stairs nearest the entrance. In any such public hall, recesses or returns, the length of which do not exceed twice the width of the hall, will be permitted, without an additional window, but otherwise each recess or return shall be regarded for the purposes of this section as if it were a separate hall. Any part of a public hall which is shut off from any other part by a door or doors shall be deemed a separate public hall within the meaning of this section.

Sec. 646. (Public Halls.—Windows In.)—In every new tenement house one at least of the windows provided to light each public hall or part thereof shall have a glass area of at least twelve square feet.

Sec. 647. (Rooms and Halls.—Additional.)—Any additional room or hall that may hereafter be constructed or created in an existing tenement house shall comply in all respects with the provisions of this chapter as to size, arrangement, light and ventilation of rooms and halls.

Sec. 648. (Shafts.—Inner and Outer Vent.—Dimensions.)—Inner or outer vent shafts of all tenement houses as defined in Section 606 of this chapter shall be of the following dimensions:

Building.	Square Feet.	Least Width.
2 stories.....	22½	3 feet
3 stories.....	27	3 feet
4 stories.....	36	3 feet
5 stories.....	48	5 feet
6 stories.....	72	6 feet
7 stories.....	96	8 feet
8 stories.....	120	8 feet

**Sec. 649. (Skylight Over Stairs.—Ventilating.—Area Of.)**—In every new tenement house there shall be in the roof, directly over each stair well, a ventilating skylight, which shall have a glazed surface of the following dimensions: Where such tenement house shall not exceed two stories in height, and covering a superficial ground area of not to exceed sixteen hundred square feet, the glazed surface in such ventilating skylight shall be not less than fifteen square feet in area. For a three-story building, with a superficial ground area of not to exceed sixteen hundred square feet, the glazed surface of such ventilating skylight shall be not less than twenty square feet in area. For all buildings in excess of three stories and covering a superficial ground area in excess of 1,600 square feet, the glazed surface of such ventilating skylight shall be not less than twenty-five square feet in area; provided, however, that such ventilating skylights shall not be required in any of such buildings where the stairways are lighted by a window on each story landing.

If the building is more than three stories high, the skylights shall have at least six inches above same a strong wire netting (wire not lighter than No. 8 and a mesh not coarser than one and one-half by one and one-half inches) unless the glass contains a wire netting within itself.

**Sec. 650. (Flues in Walls.)**—In every new tenement house there shall be adequate flues in walls of masonry not less than forty-nine square inches area in each chimney running through every floor, with an open fireplace or grate or place for a stove, properly connected with one of such chimney flues, for every apartment, every additional flue used shall not be of less size than the above.

**Sec. 651. (Cellar and Basement.—Ceilings.—Ventilation.)**—All cellar and basement ceilings, unless the floor construction be fireproof, shall be plastered, and that part of the ceiling over the boiler or furnace extending two feet beyond in each direction shall be covered with metal lath and shall be plastered with cement, and every cellar shall be ventilated from both ends.

**Sec. 652. (Damp-Proofing.—Basement Walls and Floors.)**—Every new tenement house shall have all its outside walls below the adjacent ground level plastered on the outside with Portland cement or treated with other approved damp-proofing material, and such walls, as high as the ground level, shall be laid in cement mortar. The basement or cellar shall have a floor of Portland cement concrete not less than three inches in thickness.

**Sec. 653. (Cellar Changed for Living Purposes.—Requirements.)**—In no now existing or new tenement house shall any room in the cellar be constructed, altered, converted or occupied for living purposes; and no room in the basement of a tenement house shall be constructed, altered, converted or occupied for living purposes, unless all of the following conditions of this chapter be complied with, and at least one-third of the height of the basement shall be above grade for building; provided, in each case it shall be at least four feet above the street grade.

**Sec. 654. (Cellar Rooms.—Height.)**—Such rooms shall be at least 8 feet 6 inches high in all now existing or new tenement houses in every part, from floor to the ceiling, except as provided for janitor's use only in Section 640 of this chapter.

**Sec. 655. (Water Closet.)**—There shall be appurtenant to such room or apartment, a water closet conforming to the regulations and ordinances of the city relating to water closets.

**Sec. 656. (Shafts, Areas, Etc., to Extend Two Inches Below the Floor.—Graded.—Concreted.—Drained.)**—In every new tenement house, the bottom of all shafts, courts and yards which extend to the basement and light and ventilate the living rooms in such basement shall, by means of areas, not less than two feet six inches in their least dimension or otherwise, be extended a distance of at least two inches below the floor level of the part intended to be occupied. All shafts, inner courts and areas which extend to the ground shall be properly concreted, and all shafts, inner and lot line courts and areas shall be properly graded and drained, and shall be so connected with a street sewer through an intermediate trap or surface basin (where such a sewer is adjacent to the lot), that all water may be drained freely into it.

**Sec. 657. (Sinks.—Requirement.)**—In every new tenement house there shall be in each apartment at least one proper sink with running water. In every now existing tenement house there shall be on every floor at least one proper sink with running water, accessible to all the tenants of that floor, without passing through any other apartment, if there be not one such sink in each apartment. In no tenement house shall there be woodwork inclosing sinks located in the public halls; the space underneath sinks shall be left entirely open.

**Sec. 658. (Water Closets.—Access to.—Windows in.—Artificial Light.)**—In every new tenement house there shall be a separate water closet in a separate compart-

ment within each apartment, accessible to each apartment, without passing through any other apartment, provided that where there are apartments, consisting of only one or two rooms, there shall be at least one water closet for every two apartments. Every water closet compartment in every new tenement house shall have a window opening upon a street, alley, yard, court or vent shaft, and every water closet compartment in every existing tenement house shall be ventilated by such a window, or else by a proper ventilating pipe running through the roof. Every water closet compartment in every tenement house shall be provided with proper means of artificially lighting the same. If fixtures for gas or electricity are not provided in any such compartment, then the door thereof shall have ground glass or wire glass panels or transoms.

**Sec. 659. (Sanitary Requirements.)**—No drip trays shall be permitted in new tenement houses. All water closet fixtures in every new tenement house shall be constructed and set up conformably to the Requirements of the Department of Health. All privy vaults used in connection with any existing tenement house shall be replaced by water closets, constructed and set up in conformity with the provisions of this chapter, whenever connection with a public sewer is in any way practicable, and the Department of Health of the city shall be the sole judge as to the practicability of such connection with the public sewer. At least one such water closet shall be provided for every two apartments in each existing tenement house, and such water closets may be located in the yard if necessary. If so located, long hopper closets may be used, provided all traps, flush tanks and pipes be protected against frost.

**Sec. 660. (Loads.—Allowances for Live Loads in Construction of Floors.)**—For all buildings of Class VI. the floors shall be designed and constructed in such a manner as to be capable of bearing in all their parts, in addition to the weight of the floor construction, and including the weight of partitions and permanent fixtures and mechanisms that may be set upon the same, a live load of forty pounds for every square foot of surface in such floors.

**Sec. 661. (Pipes Through Floors.)**—In every new tenement house where plumbing or other pipes pass through floors or partitions, the openings around such pipes shall be sealed or made air tight with plaster or other incombustible material, so as to prevent the passage of air or the spread of fire from one floor to another or from room to room.

**Sec. 662. (Catch Basins.)**—The covers of all catch basins in lots containing tenement houses shall be of stone or iron, and shall be placed in courts or yards flush with the surface of such courts or yards, so that access to such basins may be convenient.

**Sec. 663. (Stairways.—Fire Escapes to be Free From Incumbrance.)**—No incumbrance of any kind shall at any time be placed before, upon or against any stairway, steps or landings or fire escapes in or upon any tenement house. All fire escapes upon tenement houses shall be kept in good order and repair, and every exposed part thereof shall at all times be protected against rust by durable paint.

**Sec. 664. (Water Closets.—Access To.)**—In every apartment of three or more rooms in every new tenement house convenient access from the outer door of the apartment to every living room and to every bedroom, and to every room used as a bedroom, and to at least one water closet compartment, shall be provided otherwise than through any bedroom or room used as a bedroom.

**Sec. 665. (Buildings Damaged by Fire, Etc.)**—If any existing tenement house is hereafter damaged by fire or other cause (including ordinary wear) so that at any time its value be less than one-half its original cost (exclusive of the value of the foundations) such building shall not be repaired or rebuilt except in conformity with the provisions of this chapter applicable to new tenement houses.

**Sec. 666. (Changes or Alterations.—Permits.)**—Every new tenement house and all changes or alterations in any existing tenement house shall conform to the requirements of this chapter. No new tenement house shall be begun, nor shall any changes or alterations in any existing tenement house, such as are referred to in this chapter, be begun until a permit therefor shall have been issued by the Building Department of the city. Such permit shall be issued only upon an application by the person for whom the building is to be erected or altered, and after approval of the plans and specifications of such tenement house, or such changes or alterations by the Health Department of the city whenever such approval is required by law or ordinance.

**Sec. 667. (Notice to be Sent to Commissioner of Buildings to Inspect.—Certificate to be Issued.—Notice to Inspect to be Filed.)**—It shall be the duty of the owner  
659 to 667—435 to 443

or his agent, when a tenement house is in course of erection, to notify the Commissioner of Buildings of the city when the building is or will be ready for lathing, and the Commissioner shall, within three days of the time specified, cause an inspection to be made, and if the construction is found to be in accordance with the requirements of this chapter he shall issue or cause to be issued a certificate to that effect; otherwise he shall cause the penalties provided in Section 669 of this chapter to be enforced. The Commissioner shall file for reference the notice received and shall also file a copy of the certificate in the office of the Building Department.

**Sec. 668. (Yards, Courts, Etc.—Must Comply as to.)**—Any tenement house not conforming in itself and in its yards, courts, areas and shafts to the requirements of this chapter shall not be occupied, or if found occupied shall forthwith be vacated upon notice from the Commissioner of Buildings, and such tenement house shall not again be occupied until made to conform in all respects with the provisions of this chapter, notwithstanding the issuance of a building permit for the erection or alteration of such building.

**Sec. 669. (Violations.—Penalty For.)**—Any owner, lessee, tenant, occupant or agent of any tenement house, or any architect, contractor, builder or foreman superintending or in charge of the work of construction of any tenement house violating, disobeying, neglecting or refusing to comply with or resisting the enforcement of any of the provisions of this chapter shall be fined not less than ten dollars nor more than two hundred dollars for each offense, and any violation of any provision of this chapter, if continued after the first fine is imposed, shall, for every week of such continuance, be punishable by an additional fine of not less than ten dollars nor more than two hundred dollars.

**Sec. 670. (Provisions of this Chapter not to Apply to Existing Buildings, Except Under Certain Conditions.)**—Nothing in this chapter contained shall be considered as requiring alterations in the construction or equipment of buildings in existence at the time of the passage of this ordinance, and which at the time of their construction were built in compliance with the ordinances then in force, unless such building shall not have sufficient or adequate means of egress therefrom or ingress thereto by reason of insufficient or inadequate stairway or stairways improperly located or insufficient or inadequate elevators or elevator equipment, doors, fire escapes, windows or other means of egress or ingress.

If, however, it is desired to enlarge or in any manner materially modify the construction of any existing building, or to make any change in its use or occupation which will transfer it from one class, as defined by this chapter, to another class, then before such enlargement or structural change or modification of building is made, or before such change in its use or occupation may be made, the entire building shall be reconstructed or modified in such manner as to bring the same, when enlarged or altered, or when occupied for its new and different purposes, into accordance with the provisions of this chapter.

**Sec. 671. (Commissioner Shall Notify.)**—Where it shall appear to the said Commissioner that any such building has inadequate or insufficient means of egress therefrom or ingress thereto, as aforesaid, he shall notify the owner, agent or person in possession, charge or control of such building, of such fact, and direct him forthwith to make such alterations and changes in the construction or equipment of such building as are necessary to be made in order to promote the safety of the occupants of such building and of persons using the same and of the public.

**Sec. 672. (Where Conflicting with Other Sections.)**—In cases of direct conflict with the provisions of other sections of this chapter relating to other classes, the provisions of the sections relating to Class VI. shall govern in respect to tenement houses.

## ARTICLE X

### PROVISIONS RELATING SOLELY TO CLASS VII.

**Sec. 700. (Class VII.)**—In Class VII. shall be included all buildings used for the sale at retail of dry goods and other articles of general merchandise and commonly known and described as "department stores."

**Sec. 701. (Buildings of Class VII.—Construction Of.)**—Buildings used either wholly or in part for the purposes of Class VII. three stories or less in height may be of ordinary construction.

Such buildings more than three and not exceeding five stories in height shall be of slow-burning, mill or fireproof construction.

Such buildings over five stories in height shall be of fireproof construction.

Sec. 702. (Walls.—Thickness Of.)—The thickness of inclosing walls shall conform to the following requirements:

	Basement.	STORIES											
		1	2	3	4	5	6	7	8	9	10	11	12
One-story .....	12	12											
Two-story .....	16	12	12										
Three-story .....	16	16	12	12									
Four-story .....	20	20	16	16	12								
Five-story .....	24	20	20	16	16	16							
Six-story .....	24	20	20	20	16	16	16						
Seven-story .....	24	20	20	20	20	16	16	16					
Eight-story .....	24	24	24	20	20	20	16	16	16				
Nine-story .....	28	24	24	24	20	20	20	16	16	16			
Ten-story .....	28	28	28	24	24	24	20	20	20	16	16		
Eleven-story .....	28	28	28	24	24	24	20	20	20	16	16	16	
Twelve-story .....	32	28	28	28	24	24	20	20	20	16	16	16	16

Provided, however, in buildings of steel skeleton, fireproof construction thickness of walls shall be governed by Section 911 of this chapter.

**Walls, Ledges, Etc.**—See Section 997.

**Walls Around Stairs, Elevators and Shafts.**—See Section 998.

**Walls Reinforced (Concrete).**—See Section 960.

Sec. 703. (Stories Used for the Retail Sale of Goods.—Occupation of Basement.—Lockers.)—Not more than the lower twelve stories above the street grade shall be used for the retail sale of goods, or for employes' locker rooms or for manufacturing purposes in a building devoted wholly or in part to purposes of Class VII., provided, however, the stories above the twelfth story may be used for these or other purposes when the stairs are built as described in Section 709 of this chapter.

Not more than one floor of any basement or cellar shall be used for the retail sale of goods. Such floor shall be the floor nearest to the inside street grade. Such floor used for the retail sale of goods shall not be more than twenty feet below the inside street grade.

No sub-basement, cellar or part of a basement below such floor shall be used for the sale of any goods in any manner, but locker and dressing rooms may be placed in the sub-basement, provided the space thus occupied be separated from the remainder of the basement by fireproof partitions, and that there be at least two flights of stairs placed as far apart as practicable leading therefrom to the first floor inclosed in fireproof partitions as provided in Sections 936, 937 and 938 of this chapter. Such stairs from such locker or dressing rooms shall be in addition to other stairways required by this chapter in such building, provided that at least one of such stairways shall open directly on a street, alley or court opening on a street or alley or a fireproof passage leading to the street, alley or such court. Where more than five lockers are in one room such lockers shall be of incombustible material.

Sec. 704. (Floor Areas.—Maximum.)—The floor area of any one story or portion of a story used for the purposes of Class VII. of any building of ordinary construction shall not exceed nine thousand square feet.

The floor area of any one story or portion of a story used for the purposes of Class VII. of any building of slow-burning or mill construction shall not exceed twelve thousand square feet.

The floor area of any one story or a portion of a story used for the purposes of Class VII. of any building of fireproof construction shall not exceed 25,000 square feet.

Sec. 705. (Floor Areas.—Exceeding the Maximum Limits Defined in Section 704.)—Where any floor or portion of a floor used for the purposes of Class VII. in any building shall exceed in area the maximum number of square feet allowed in the preceding section for the type of construction of such building in which such floor is contained, each such maximum amount of floor area so used shall be separated from other parts of such floor by fire walls or dividing walls built in accordance with the provisions of Section 109 of this chapter relating to dividing walls in buildings of Class I.

Where any such floor so used is divided by such fire walls or dividing walls, each such division of such floor shall be provided with stairs, aisles, exits and fire escapes, as is required in this chapter for separate and distinct buildings, and each such division shall be considered as a separate building.

Sec. 706. (Galleries.)—The area of any one or all of the galleries, mezzanine or intermediate floors in any one story used wholly or in part for the purposes of

Class VII. in any building shall not exceed 10 per centum of the area of such story, and galleries, mezzanine or intermediate floors of a larger size than the above shall be considered as full stories.

Every gallery, mezzanine or intermediate floor shall have at least one stairway not less than three feet wide.

The height from the floor of any gallery, mezzanine or intermediate floor to the ceiling over same shall not be less than seven feet, and there shall be not less than seven feet space between the bottom of such gallery, mezzanine or intermediate floor, and the floor of the story in which such gallery, mezzanine or intermediate floor is placed.

Every gallery, intermediate or mezzanine floor used for the purposes of Class VII. in any building shall be built entirely of fireproof or incombustible construction with the exception of the floor surface and nailing strips, which may be of wood.

No gallery, intermediate or mezzanine floor shall be built without a permit from the Department of Buildings, and plans showing the construction and size of such proposed gallery, intermediate or mezzanine floor shall be filed with the Department of Buildings when a permit is applied for.

**Sec. 707. (Courts of Class VII. Buildings.)**—Every court or light shaft of every building used wholly or in part for the purposes of Class VII. shall be open and unobstructed from the floor of such court to the sky, with the exception that fire escapes may be built therein, and such court shall have walls constructed in the same manner as is required for the exterior walls of such buildings; provided, that no walls inclosing such courts are required on street or alley lot lines.

All windows, doors or other openings in court walls of such buildings shall have metal frames, metal sashes and metal doors, with the glazed portion thereof of fire-resisting glass.

**Sec. 708. (Stories.—Numbering Of.)**—The first story above the inside street grade shall be designated and known as the first story for all purposes of this chapter, and the stories above shall be numbered, consecutively, the second, third, and so on.

**Sec. 709. (Stairways.—Interior Stairways in Buildings of Class VII.)**—Buildings used wholly or in part for purposes of Class VII. shall have two stairways if the aggregate floor area is five thousand square feet or less, three stairways if the aggregate floor area is more than five thousand square feet and not more than ten thousand square feet, and four stairways if the floor area is more than ten thousand square feet.

The number of stairways and the aggregate width of stairways required for the various floor areas shall be as indicated in the table hereinafter set forth in the following section.

The width of the different stairways need not be alike, and for each four stories, or fractional number of stories, of the building above the first four stories, each stairway may be reduced by six inches, as set forth in the table of stairs in Section 710, but no stair in a Class VII. building shall be of a less width than three feet.

Stairways in buildings used wholly or in part for the purposes of Class VII. shall be located as far apart as practicable, and shall have hand rails on each side thereof, and no such stairway shall be a spiral stairway or have any winders. The height of the individual riser shall not exceed seven and three-eighths inches. The width of the individual tread shall be not less than ten inches. Stairways which are over seven feet wide shall have double intermediate hand rails with end newel posts at least five and one-half feet high.

The bottom of each stairway shall be in the immediate vicinity of the top of the stairs leading to the next lower story, and the line of travel from stairway to stairway shall be direct and easily accessible each to the other.

Every story below street grade shall have not less than two stairways to the first story and each such stairway shall be not less than three feet wide, but where a basement or cellar is used for the retail sale of goods the stairways from such basement or cellar shall be in number and aggregate width as indicated in the table of stairways set forth in the following section for the lower four stories of the same building.

The whole number of stairways required for any such building shall be complete in every respect from the first to the topmost floor, and each stairway shall be extended to the roof.

707 to 709—455 to 457

Sec. 710. TABLE OF STAIRWAYS FOR CLASS VII. BUILDINGS.  
AGGREGATE WIDTH OF STAIRWAYS.

Building Area.	—SQUARE FEET OF—

5,000	10 feet	9 feet	8 feet	7 feet	2 stairways	
4,000	9 feet	8 feet	7 feet	6 feet	2 stairways	
3,000	8 feet	7 feet	6 feet	6 feet	2 stairways	
2,000 and less	7 feet	6 feet	6 feet	6 feet	2 stairways	

Sec. 711. (Stairs.—Fireproof Interior.)—Where an interior stairway and its stair hall of a building used wholly or in part for the purposes of Class VII. are inclosed in all stories of the building by fireproof partitions built as described in Section 936 of this chapter for fireproof construction, and where the stairways and landings are built as described in Section 938 of this chapter for fireproof construction, and where the doors, frames, sashes and casings and the glazed portions thereof are built as described in Section 927 of this chapter for fireproof construction, then such stairway, if not less than five feet in width from first floor to the topmost floor, shall be considered as the equivalent of two open stairways, but in no case shall there be less than two stairways in any such building.

Sec. 712. (Stories.—Where Stories Above Twelfth Are Used for Class VII. Purposes.)—Where stories above the twelfth story are used for the purposes of Class VII. as hereinbefore described for employes' locker rooms, then the stairways from the first to the topmost floor shall be built and inclosed as described in the preceding section, but the stairways shall be in number and in their aggregate width as required in the table of stairways set forth in Section 710 of this chapter.

Sec. 713. (Stairs.—Halls.—Passageways and Aisles.—Signs and Lights.)—The stair halls, passageways or stair aisles shall be unobstructed and shall be as wide as the stairs, and not less than four feet wide in any place in the clear.

The exit door or doors between floors and stair halls shall be as wide as the stairway to which they afford access, and for each elevator opening into such a stair hall the doors to floors shall be increased to two feet in width.

The stairways and stair halls of any building used wholly or in part for the purposes of Class VII. shall be illuminated by gas or electric light, and the gas piping and the electric wiring shall be accomplished by piping and circuits separated and distinct from the general illuminating piping and circuits of the premises. Each stair light shall have a red glass inclosure.

At the bottom of each such stairway there shall be an illuminating red glass sign with the number of the story in which it is situated inscribed thereon in letters not less than six inches high.

Sec. 714. (Aisles in Class VII Buildings.)—In buildings used wholly or in part for the purposes of Class VII. there shall be aisles in such portions of the building as are used for such purposes, connecting the stairway and the elevators directly with the street or alley doors, and such aisles shall be termed "main aisles." Such main aisles shall have a clear width equal to the width of the stairways connecting therewith, and for each elevator connecting with such an aisle there shall be an additional width of six inches, and no such main aisle shall be less than five feet wide in the clear between the counters in any department store or between the fixed seats therein. One-third the width of any basement stairway shall be added to the width of the main aisle connecting with such stairway.

If there is a column in any such aisle, then the width of the aisle shall be increased by the width of such column.

If there is a counter or counters or settee, or any case or other obstruction, in an aisle, then that part of the aisle on each side of such counter, settee or case

or other obstruction shall be considered as a separate aisle. No aisle other than a main aisle shall be less than three feet in width.

**Sec. 715. (Exit Signs and Lights.)**—All exits in buildings used wholly or in part for the purposes of Class VII. shall be clearly indicated by illuminated red signs with the word "EXIT" thereon in letters not less than six inches high. At the bottom of each stairway on the street level floor there shall be similar signs indicating the direction of the nearest exit to a street or alley.

Fire escape doors or windows shall be indicated by illuminated red signs with the words "FIRE ESCAPE" thereon in letters not less than six inches high.

**Sec. 716. (Doors at Street Level.—Revolving Doors.)**—The clear width of the exit openings shall be computed in the same manner as provided for main aisles, and no door openings shall be less than five feet wide, and all doors shall swing outward. Revolving doors shall not be considered as exits, *unless the revolving wings of said revolving doors are so arranged that by the application of a force slightly more than necessary to revolve said doors and which one person of ordinary strength is capable of exerting, all the wings of said doors fold flat on each other and in an outward direction, and unless each side, or the half circles of such revolving doors, are hinged and fastened so as to likewise swing backwards on application of force slightly beyond the normal, and which will permit of exit space for two ordinary persons on either side of the collapsed wings of said revolving doors and their inclosing half circles.*

As amended by ordinance March 30, 1906, by addition of the part in italics.

**Sec. 717. (Doors in Dividing Walls.)**—Door openings may be built in dividing walls of such buildings, provided, however, that such door openings shall be provided with fireproof doors built as described in Section 110 of this chapter, and that each door shall have an efficient closing device, automatic in operation in the event of a fire, in close proximity to such door and on each side of such opening.

Each such opening shall have exit signs and lights as provided for street doors and exits in Section 715 of this chapter. There shall be aisles not less than five feet in width connecting with such doors from the main aisles, and in no case shall any such door be of less width than the aisle directly connecting therewith.

**Doors and Windows.—When Required to Be Closed.—Fire Resisting Glass.**—See Section 1049.

**Sec. 718. (Floors.—Strength Of.—Allowance for Live Loads.)**—Every structural part of every building used wholly or in part for the purposes of Class VII. shall safely support, in addition to the weight of floor construction, partitions and permanent mechanisms that may be set upon the same, a live load of not less than one hundred pounds per square foot of floor area, and the construction shall be calculated according to the safe unit stresses elsewhere defined in this chapter. Every part of any such building which is subjected to a live load of more than one hundred pounds per square foot of floor space shall be of sufficient strength in the parts which support such load to safely support the load imposed, calculated according to the safe allowable unit stresses elsewhere defined in this chapter.

**Sec. 719. (Fire Escapes in Class VII. Buildings.)**—Every such building more than two stories in height shall have two stairway fire escapes. Such stairway fire escapes shall each be not less than thirty-six inches wide between centers of hand rails. Such stairway fire escapes shall be at opposite ends of the building or as far apart from each other as practicable.

**Sec. 720. (Passageways.—Fireproof.)**—Where stairway fire escapes do not extend to the ground level they shall have a counterbalanced stairway to the ground from a platform not more than twenty feet above the ground level.

Fire escapes in inclosed courts shall have open, unobstructed fireproof passageways leading directly to a street or an alley.

**Sec. 721. (Fire Escapes.—Windows and Railings On.—Doors Opening On.)**—All windows and doors which are passed by a fire escape of any kind, and all windows and doors opening on fire escape platforms or landing shall have fireproof frames glazed with fire-resisting glass.

Each fire escape platform shall have at least one window on each floor in any such building opening thereon.

Each such window shall be indicated by signs and lights as required in Section 715 of this chapter for exits.

Where window sills at fire escape exits are more than two feet above the floor, one or more steps not less than three feet wide shall be provided, with risers not to exceed twelve inches high and treads not less than eight inches wide.

The railings on stairway fire escapes and the railings around fire escape platforms shall have iron guards in addition to the iron hand rails; such guards shall be not less than four feet high measuring from the outer corner of the tread or from the platform; such guards shall have a mesh or openings not over two and one-half inches square, and the metal strands in such guards shall have a cross section of not less than one-eighth of an inch in diameter.

**Sec. 722. (Fire Drill of Employees.)**—It shall be the duty of every person or corporation maintaining or in possession, charge or control of any building used wholly or in part for the purposes of Class VII, to designate certain adult male employes in such building (the number of which employes shall be prescribed by the Fire Marshal), who shall be regularly and throughout the entire time such building is open to the public employed in such building, and who shall be physically and mentally able to perform the duties which shall be required of them in case of fire occurring in any such building. Such employes shall at least once in each month, when directed by the Fire Marshal or any authorized member of the Fire Department, take part in a fire drill conducted by the Fire Marshal, or any authorized member of the Fire Department, in the use of all apparatus for the prevention and extinguishing of fire in such building, whenever the Fire Marshal shall deem such drill necessary or advisable. Such person or corporation shall pay to the city the proportion of the regular salary of any employe of the Fire Department who shall be employed in drilling and examining the employes of any such building, based upon the time of such employment, and the Fire Marshal shall render bills monthly for such services.

**Sec. 723. (Standpipes.—Pumps.—Axes, Etc.)**—Amended by ordinance March 19, 1906, to read as follows:

(1) *In every building over one hundred (100) feet in height not provided with a three (3) inch or larger inside standpipe; in all buildings hereafter constructed of a greater height than seventy-five (75) feet (except buildings used for theater purposes, as herein elsewhere provided for); in all buildings used for hospital purposes of a greater height than three (3) stories with accommodations for at least twenty (20) patients; and in all buildings of a greater height than five (5) stories now or hereafter used for hotel or public lodging house purposes there shall be constructed one (1) or more four (4) inch standpipes, which shall extend from basement to roof, and which shall be connected at street or alley side of building with two-way Siamese connection for use of fire department, and which shall be provided with one hose connection, with fire department thread on the roof of said building, on each floor and in the basement thereof, with sufficient hose attached to reach any point thereof. The pattern, quality, installation and maintenance of such standpipe, hose and couplings shall be subject to the approval of the Fire Marshal.*

(2) *In any of the buildings herein referred to where approved sprinkler systems are installed and properly maintained, it shall not be necessary to install additional inside standpipe as above provided for.*

(3) *On each floor and in the basement of every building used for hotel, public lodging, hospital or school purposes, three or more stories in height, on each floor of all apartment buildings over three (3) stories in height the floors of which are divided into two or more apartments; on each floor of all office buildings, four (4) or more stories in height, the floors of which exceed two thousand (2,000) square feet in area; on each floor of all mercantile buildings three (3) or more stories in height, having a floor area of two thousand (2,000) or more square feet which is not equipped with approved wet sprinkler system, standpipe and hose, there shall be provided two (2) or more portable hand pumps, or chemical extinguishers, one or more fire axes, and one or more pike poles, all of which shall be installed and maintained subject to the approval and supervision of the Fire Marshal. As amended by ordinance March 19, 1906.*

(4) *The interior of all grain elevators and malt houses of a height of fifty (50) or more feet, which are not entirely fireproof, and which have a capacity of two hundred and fifty thousand (250,000) bushels or over, and the interior of all cold storage houses of a height of four (4) or more stories, which are not entirely fireproof and which have a ground floor area of ten thousand (10,000) or more square feet, shall be equipped with either a dry or a wet sprinkler system, to each of which systems there shall be a feeder or riser pipe or pipes of not more than four (4) inches in diameter, leading from one or more Siamese steamer connections, all of which shall be installed and maintained subject to the approval of the Fire Marshal.*

(5) *Grain elevators which are equipped with Journal Fire Alarm Systems of the most approved pattern and which are left at all times in the most perfect working order, or grain elevators, malt houses and cold storage houses, which are now equipped with standpipes of approved pattern and hose with not less than two (2) inch connections, which have been installed in accordance with city ordinances and approved by the Fire Depart-*

ment, each floor of which is approved by said department as being at all times easily accessible to firemen, where fire extinguishers, water barrels and pails are distributed at intervals on all floors, on advice and instruction of the Chicago Underwriters' Association; where the necessary pump pressure is maintained; where some approved electric watch service and fire alarm system is maintained and watchmen are employed during nights, Sundays and holidays, pulling such stations not less frequently than once per hour, and which have outside Siamese connections and standpipes not less than two and one-half (2½) inches, shall be exempt from the provisions of this ordinance.

ARTICLE XI.

PROVISIONS RELATING SOLELY TO CLASS VIII.

Sec. 800. (Class VIII.)—In Class VIII. shall be included every building used exclusively for school purposes.

Sec. 801. (Buildings of Class VIII.—Construction Of.)—All buildings used wholly for the purposes of Class VIII. hereafter erected shall be constructed in accordance with the provisions of this ordinance relating to Class VIII. as follows, viz.:

Such buildings having a seating capacity of less than four hundred, or which are not over two stories and basement in height, may be built of ordinary construction.

Such buildings having a greater seating capacity than four hundred and less than eight hundred, or which are not over three stories and basement in height, shall be built of slow burning or fireproof construction.

Such buildings having a greater seating capacity than eight hundred, and which are more than three stories and basement in height, shall be built entirely of fireproof construction.

New additions to existing buildings may be built; provided, however, that such new additions shall comply with the above requirements.

All alterations in existing buildings used wholly for the purposes of Class VIII., other than new additions thereto, intended to make them comply with the requirements of this chapter, may be executed in the same materials of construction at present employed in such buildings, unless otherwise distinctly provided herein.

Sec. 802. (Frame Buildings.—Portable.)—Portable frame buildings used wholly for the purposes of Class VIII., not larger than twenty-eight feet by thirty-six feet, and not over one story high, may be erected, provided the exterior walls and roof of same are covered with metal or incombustible material, and the interior wood-work painted with fireproof paint, approved by the Commissioner of Buildings. And provided, further, that the location of such buildings shall be approved by the Commissioner of Buildings. Such portable buildings shall not be located nearer than ten feet to any other building, and shall not be maintained on any one lot or block for a longer period than two years after the date of the issuance of the permit therefor without a new permit from the Commissioner of Buildings.

Doors and Windows.—(When Required to Be Closed.—Fire-Resisting Glass.)—See Section 1049.

Sec. 803. (Walls.—Window Openings In.)—No wall of any building used wholly for the purposes of Class VIII. containing a window opening shall be nearer than five feet to any lot line of adjoining property (street and alley lines not included).

Sec. 804. (Walls.—Thickness Of.)—The following regulations shall govern the construction of buildings used wholly for the purposes of Class VIII.:

The thickness of surrounding walls and of all dividing walls carrying the load of floors or roof shall be as indicated in the following table, to-wit:

Walls Around Stairs, Elevators and Shafts.—See Section 998.

	—STORIES—					
	Basement.	1	2	3	4	5
	in.	in.	in.	in.	in.	in.
One story .....	16	12				
Two stories .....	16	16	12			
Three stories .....	16	16	16	12		
Four stories .....	20	20	16	16	12	
Five stories .....	24	20	20	16	16	16

Buildings built of fireproof construction shall be excepted from the foregoing provisions of this section, but shall comply with the other provisions of this chapter governing such buildings.

Sec. 805. (Loads.—Live.)—The floors of buildings used wholly for the purposes of Class VIII. shall be designed and constructed so as to be capable of bearing in

800—,      801 to 865—472 to 476

all their parts, in addition to the weight of floor construction, partitions, permanent fixtures and mechanisms that may be set upon same, a live load of seventy-five pounds per square foot.

**Sec. 806. (Stories.—Height Of.)**—No story above the basement shall be less than twelve feet in height in the clear.

**Sec. 807. (Floor Levels in Buildings of Fireproof Construction.)**—The following limitations of floor levels of auditoriums or assembly halls of such buildings shall be observed in all cases:

In buildings of fireproof construction.

Not to exceed two thousand seating capacity, not over ten feet above sidewalk level.

Not to exceed one thousand seating capacity, not over thirty feet above sidewalk level.

Not to exceed eight hundred seating capacity, not over fifty feet above sidewalk level.

Not to exceed five hundred seating capacity, in any story; provided, however, that there shall be at least two separate and distinct stairways from the floor in which such auditorium or assembly hall is located to the ground, each of which shall not be less than four feet wide in the clear.

**Sec. 808. (Floor Levels.—In Buildings Having Stairs and Corridors of Fireproof Construction.)**

Not to exceed one thousand five hundred seating capacity, not over ten feet above sidewalk level.

Not to exceed one thousand seating capacity, not over twenty-five feet above sidewalk level.

Not to exceed eight hundred seating capacity, not over forty-two feet above sidewalk level.

Not to exceed five hundred seating capacity, not over fifty feet above sidewalk level.

Not to exceed two hundred and fifty seating capacity, not over sixty feet above sidewalk level.

**Sec. 809. (Floor Levels in Buildings of Mill, Slow-Burning or Ordinary Construction.)**

Not to exceed one thousand seating capacity, not over ten feet above sidewalk level.

Not to exceed six hundred and fifty seating capacity, not over thirty feet above sidewalk level.

Not to exceed five hundred seating capacity, not over forty-five feet above sidewalk level.

Not to exceed two hundred seating capacity, not over sixty feet above sidewalk level.

**Sec. 810. (Floors.—Height Of, Measured from Sidewalk Level.)**—Heights shall be measured from sidewalk level at entrance of buildings to highest part of main floor of auditorium or assembly hall.

**Sec. 811. (Stairways.—Width Of.)**—Stairways in buildings used wholly for the purposes of Class VIII. shall be in width equivalent to fifteen inches for every hundred of seating capacity in such building, as measured by the aggregate seating capacity of the auditorium, assembly rooms and school rooms; provided, however, that the number of persons allowed in such buildings at any one time shall be limited by the width of stairways available as exits therefrom.

No stairway shall be less than four feet in the clear, except where more than two stairways lead down from any floor, in which case stairways three feet wide in the clear may be counted in the total width of stairways required.

Where two or more stairways are used, they shall be placed at opposite ends of the building, or as far apart as practicable, and all such buildings hereafter erected shall have at least two separate and distinct stairways from the ground floor to the top floor, and all existing buildings shall have two such separate and distinct stairways, or one stairway and one stair or sliding fire escape.

**Sec. 812. (Stairways.—Railings on Each Side.)**—All stairways shall have railings on each side thereof.

**Sec. 813. (Stairways.—Height of Landing.)**—No stairway shall ascend a greater height than thirteen feet six inches without a level landing, which, if its width is in the direction of the run of the stairs, shall be not less than four feet wide, or which, if at a turn of the stairs, shall be of not less width than the stairs, and no winder shall be permitted in any stairs.

806 to 813—477 to 483

Sec. 814. (Stairways.—Fireproof.)—In such buildings hereafter erected more than two stories and basement in height, the stairways and their enclosing wall shall be of fireproof construction.

Sec. 815. (Corridors, Passageways, Hallways and Doors.—Width Of.)—The width of corridors, passageways, hallways and doors shall be computed in the same manner as that herein provided for stairways; provided, however, that no corridor shall be anywhere less than five feet in width, and no door less than three feet in width, except where two or more doors, each two feet four inches or more in width, are grouped together.

Sec. 816. (Doors to Open Outward.)—All doors in such buildings shall open outward, and all entrance and exit doors shall be unlocked at all times when the building is occupied for school purposes, or open to the public.

Sec. 817. (Doors—Exits Covered With Metal.)—Amended by ordinance March 30, 1906, to read as follows:

*All exit doors from assembly halls to other parts of the building shall be covered with metal or other fireproof material, approved by the Commissioner of Buildings.*

Sec. 818. (Aisles.—Width Of.—Number of Seats in Auditorium.)—Aisles in auditoriums and assembly halls in such buildings shall be in width equivalent to eighteen inches for every one hundred of seating capacity in such auditorium or assembly hall, but no such aisle shall be less than two feet six inches wide in its narrowest part. All groups of seats shall be so arranged that they shall have an aisle on each side, and not more than twelve seats in any one row shall be placed between aisles.

Sec. 819. (Aisles in Class and Recitation Rooms.)—Aisles in class rooms, recitation rooms and study rooms of such buildings shall be in width equivalent to eighteen inches for every one hundred permanent seats in any such room, but no main or cross aisle shall be less than two feet six inches wide in its narrowest part.

Sec. 820. (Aisles and Passageways.—Kept Clear of Obstructions.)—All aisles and passageways in such buildings shall be kept free from camp stools, chairs, sofas and other obstructions, and no person shall be allowed to stand in or occupy any of such aisles or passageways during any performance, service, exhibition, lecture, concert or any public assembly, nor shall there be any chairs, settees or camp stools in such aisles or corridors at such times or occasions.

Sec. 821. (Emergency Exits for Auditoriums or Assembly Rooms.—Aggregate Width Of.)—All auditoriums or assembly halls of such buildings having a seating capacity of eight hundred or more shall be provided with emergency exits. The aggregate width of such emergency exits which shall be provided for each floor, balcony or gallery of such auditorium or assembly hall shall be one-half of the width of the main exit. No emergency exit or stairway shall be less than three feet in width.

Sec. 822. (Exits.—Signs.)—All exits opening from auditoriums and assembly halls of such buildings shall have the word "EXIT," in letters at least six inches high, applied to the auditorium side of such exit, and when such auditorium or assembly hall is used at night, a red light shall be kept burning over the word "EXIT" during the entire time such building is so used and until the pupils or audience have left the building.

Sec. 823. (Lights in Buildings.)—Every portion of any such building devoted to the uses or accommodation of the public and all outlets therefrom leading to the streets, including the open courts and corridors, stairways and exits, shall be well and properly lighted during the entire time such portion is in use, and shall remain lighted until all the pupils or the audience have left the premises. All gas or electric lights in the halls, corridors, lobbies, stairs and exits leading from the auditorium or assembly halls shall be controlled by a separate shut-off and shall be independent of all other lights in such building.

Sec. 824. (Windows.)—The total glass area of outside windows and skylights of each class room, recitation room or study room in such buildings shall be not less than one-ninth of the floor area of such room.

Sec. 825. (Basement.)—In every such building in which the lower or basement floor is below the surface of the ground surrounding such building, and is used in part or as a whole for heating or ventilating apparatus, such floor shall be considered the basement story of such building. Permanent class rooms in basements shall not be permitted.

Sec. 826. (Fire Escapes.)—Every building used for the purposes of Class VIII. of four or more stories in height shall be provided and equipped with one or more

814 to 826—484 to 496

stairways or sliding fire escapes in such locations and numbers as shall be satisfactory to the Commissioner of Buildings.

**Sec. 827. (Fire Escapes to Be Examined.)**—It shall be the duty of the janitor of every such building, or such other employe or employes thereof as may be directed by the principal of such school to examine all fire escapes of such buildings from the topmost story to the ground, and to examine and operate all doors, windows and platforms leading to and from such fire escapes; and such inspection shall be made at least once each and every week that such building is used for school purposes, and a written report made of such inspection to the principal of such school, showing the time it was made and the condition of the fire escapes.

Such fire escapes shall be kept in good condition ready for immediate use at any and all times that such building is in use, and shall be kept free of snow and ice.

**Sec. 828. (Fire Drill.)**—The principal or other person in charge of the pupils in every such building shall establish and maintain a good and efficient fire drill, which shall be practiced at least twice every month during the time such building is used for school purposes.

A record shall be kept by the principal or other person in charge of the pupils of each fire drill held and of the time that elapses from the first fire signal until the last person is out of the building.

**(Walls.—Around Stairs, Elevators and Shafts.)**—See Section 998.

## ARTICLE XII.

### GENERAL PROVISIONS.

#### Fireproof Construction.

**Sec. 900. (Fireproof Construction.)**—In cases in which it is claimed that any equally good or more desirable mode or manner of construction, or material, or device for fireproofing, other than specified in this chapter, can be used in the erection or alteration of buildings, the Commissioner of Buildings, upon written application to him for a permit to use the same, shall have power to appoint a Board of Examiners, consisting of not less than three nor more than five members, each of whom shall have had at least ten years' experience in Chicago as an architect, engineer or builder, who shall take the usual oath of office. The said examiners shall adopt rules and specifications for examining and testing such mode or manner of construction, or material or device for fireproofing, and furnish a copy of the same to the applicant. And such specification shall provide for a comparative fire test of not less than four hours and for a period of at least two hours an average temperature of 2,000 degrees Fahrenheit shall be maintained. At the end of this test water shall be applied to the construction through a 1½-inch nozzle under 60 pounds pressure for five minutes. Hollow tile shall be used as a basis for comparison, and if the proposed material shall pass said test as well or better than hollow tile, it shall be approved as a fireproofing material. The said examiners shall thereupon notify such applicant to submit to such examination and make such tests in the presence of the said examiners, or a majority thereof, according to such rules and specifications. All expenses of such examiners, and of such examinations and tests, shall be paid by the applicant, and said examiners may require security therefor.

The said examiners shall, after such examination and tests, certify the results and their decision on the said application to the Commissioner of Buildings, who shall have power, in the event of the examination and tests being satisfactory, to grant a permit to the applicant in accordance with such decision of the said Board of Examiners.

A complete record of the proceedings and all acts and decisions of the said Board of Examiners shall be kept by the Commissioner of Buildings in his office.

The Commissioner of Buildings shall have the power to pass upon any question relative to the mode or manner of construction or materials to be used for fireproofing in the erection or alteration of any building or structure to make the same conform to the true intent and meaning of the several provisions of this chapter.

**Sec. 901. (Fireproof Construction.—Definition Of.)**—The term fireproof construction shall apply to all buildings in which all parts that carry weights or resist strains, and also all exterior walls and all interior walls and all interior partitions and all stairways and all elevator enclosures are made entirely of incombustible material, and in which all metallic structural members are protected against the effects of fire by coverings of a material which shall be entirely incombustible, and a slow heat conductor, and hereinafter termed "fireproof material." Reinforced concrete as defined in this ordinance shall be considered fireproof construction.

827-828—497-498      900-1—499-500

Sec. 902. (**Fireproof Material.**)—The materials which shall be considered as filling the conditions of fireproof covering are: First, burnt brick; second, tiles of burnt clay; third, approved cement concrete; fourth, terra cotta; fifth, approved cinder concrete.

Sec. 903. (**Concrete.—Approved Cement.**)—All approved cement concrete shall consist of a standard Portland cement, torpedo sand and crushed stone or gravel, or crushed blast furnace slag, or crushed burnt clay, the volumetric quantity of any one of these materials combined with the torpedo sand shall not exceed nine times the volume of the Portland cement. All of the ingredients of cement concrete shall be thoroughly worked and wet so as to cover each piece of stone or gravel or slag or burnt clay with moistened cement; and the cement and sand shall fill the voids between the coarse material of the cement concrete.

Cement concrete to be considered a fireproof material shall be cast and rammed in an unset condition against the metal.

Sec. 904. (**Machine or Hand Pressed Concrete.**)—Machine or hand pressed concrete bricks or blocks are not considered in this chapter as a fireproof material for the protection of metallic structural members.

Sec. 905. (**Brick, Burnt Clay, Tiles, Etc.—How Applied.**)—Brick, burnt clay, hollow tiles, porous clay, solid tiles and terra cotta shall be applied to the metal in a bed of mortar.

Sec. 906. (**Fireproof Covering.—Minimum Thickness Of.**)—The minimum thickness of fireproof covering on any metal shall be, if of hollow tile, constructed in such a manner that there shall be not less than one air space of at least three-fourths of an inch, by the width of the metal surface to be covered, within the clay covering; if of porous clay tiles, the covering shall be at least one and one-half inches thick. The minimum thickness of concrete covering any metal shall be two inches.

Sec. 907. (**Incombustible Materials.**)—A metal or fire-resisting glass of not less than one-quarter inch in thickness, or plastering, or plaster blocks, or stone or granite, or marble, or an improved cinder concrete, or one of the fireproof materials described herein shall be considered an incombustible material as called for by this ordinance.

Sec. 908.—(**Concrete.—Cinder.—Floor Filling.—Specifications For.**)—Whenever the use of a cinder concrete is permitted by this chapter, such cinder concrete shall be composed of the following named ingredients, in the proportion here described, to-wit: Five parts of clean, thoroughly burnt steam boiler cinders, no particle of which shall be larger than one (1) inch; three parts of clean grit sand, or of clean stone screenings, and one part of a Standard Portland cement; the working and wetting of these ingredients shall be done in the same manner as required for cement concrete in Section 903 of this chapter, and such a mixture of approved cinder concrete may be used only for floor filling.

Sec. 909. (**Fireproof Covering.—Measurements.**)—In every case the thickness of the covering specified in this chapter shall be measured from the extreme projection of the metal, unless otherwise provided herein.

Sec. 910. (**Skeleton Construction.**)—The term "skeleton construction" shall apply to all buildings wherein all external and internal loads and strains are transmitted from the top of the building to the foundations by a skeleton or framework of metal. In such metal framework the beams and girders shall be riveted to each other at their respective junction points. If columns made of rolled iron or steel are used, their different parts shall be riveted to each other, and the beams and girders resting upon them shall have riveted connections to unite them with the columns. If cast iron columns are used, each successive column shall be bolted to the one below it by at least four bolts not less than three-fourths of an inch in diameter, and the beams and girders shall be bolted to the columns. At each line of floor or roof beams, lateral connections between the ends of the beams and girders shall be made in such manner as to rigidly connect the beams and girders with each other in the direction of their length.

Sec. 911. (**Walls.—Enclosing.**)—If buildings are made fireproof entirely, and have skeleton construction so designed that their enclosing walls do not carry the weight of floors or roof, then their walls shall be not less than twelve inches in thickness; provided, such walls shall be thoroughly anchored to the iron skeleton, and whenever the weight of such walls rests upon beams or columns, such beams or columns shall be made strong enough in each story to carry the weight of wall resting upon them without reliance upon the walls below them. All walls shall be of fireproof or incombustible material.

Sec. 912. (**Columns.—Exterior.**)—All iron or steel used as a vertical supporting member of the external construction of any building exceeding sixty feet in height

shall be protected as against the effects of external changes of temperature, and of fire, by a covering of fireproof material consisting of at least four inches of brick, or of four inches of concrete, or of four inches of burnt clay tiles, or of four inches of hollow terra cotta, or of a combination of any two of these materials, provided that their combined thickness is not less than four inches. The thickness of four inches shall be measured from the extreme projections of the metal of the column proper.

Where stone or other incombustible material is used for the exterior facing of a building, the distance between the back of the facing and the extreme projections of the metal of the column proper shall be at least four inches, and this four-inch space shall be filled with one of the "fireproof materials."

In all cases, the brick or burnt clay, tile or terra cotta, if used as a fireproof covering, shall be bedded in cement mortar close up to the iron or steel members, and all joints shall be made full and solid.

**Sec. 913. (Fireproofing of Exterior Sides of Mullions.)**—In buildings required by this chapter to be of fireproof construction, all vertical door or window mullions over eight inches wide shall be faced with incombustible material; horizontal transom bars over six inches wide shall be faced with a fireproof or with an incombustible material.

**Sec. 914. (Spandril Beams, Girders, Lintel.)**—The metal of the spandril beams or spandril girders, or lintels of exterior walls, which support a part of exterior walls, shall be covered in the same manner, and with the same material, as specified for the exterior columns in this chapter. The covering thickness shall be measured from the extreme projection of the metal in every case.

**Sec. 915. (Fireproof Covering Independent.)**—All covering of brick, concrete, burnt clay tiles, hollow terra cotta or of a combination of any two of these materials shall be applied to all of the structural members of the exterior of a fireproof building previously and independently of the application of the architectural facing of such a fireproof building with an incombustible or fireproof material.

**Sec. 916. (Iron or Steel Plates for Support of Wall.)**—If iron or steel plates or angles are used in each story for the support of the facings of the walls within such story, such plates or angles shall be of sufficient strength to carry the weight within the limits of fiber stress for iron and steel elsewhere specified in this chapter, the enveloping material for such story, and such plates or angles may extend to within two inches of the exterior of such covering.

**Sec. 917. (Walls, Support and Fireproofing Of.)**—Where skeleton construction is used for the whole or part of a building, the enveloping material and the walls shall be independently supported on the skeleton frame for each individual story.

**Sec. 918. (Terra Cotta.)**—If terra cotta or other hollow blocks are used, as fireproof covering, they shall be backed up with brick or hollow tile or concrete; whichever is used shall be, however, of such dimensions and laid up in such a manner that the backing will be built into the cavities of the facing so as to secure perfect bond between the facing and its backing.

**Sec. 919. (Coping.)**—The upper surfaces of all breaks or offsets in external coverings and fillings and walls, as well as the tops of walls, shall be covered with stone, terra cotta, metal, concrete or fire clay copings set in cement mortar. Copings of all kinds which do not have lapped joints shall be pointed with mortar composed of one part of standard Portland cement and two parts of torpedo sand.

**Sec. 920. (Columns.—Interior.)**—The covering of interior columns shall be one or more of the fireproof materials herein described.

If such covering shall be of brick or concrete it shall be not less than four inches thick; if of burnt clay tiles such covering shall be in two consecutive layers, each not less than two and one-half inches thick, with one air space; if of porous clay solid tiles it shall consist of at least two layers not less than two inches thick each, or if constructed of a combination of any two of these materials, one-half of the total thickness required for each of the materials shall be applied, of each of such materials. Whether hollow tile, porous tile or terra cotta is used, the two consecutive layers shall be so applied that neither the vertical nor the horizontal joints in the same shall be opposite each other, and each course shall be so anchored and bonded within itself as to form an independent and stable structure.

In all cases, the brick or hollow tile, solid tiles or terra cotta shall be bedded in cement mortar close up to the iron or steel member, and all joints shall be made full and solid.

In the case of columns having an "H" shaped cross section or of columns having any other cross section, with channels or chases open from base plates to cap plates on one or more sides of the columns, then the thickness of the fireproof covering may be reduced to three inches, measuring in the direction in which the flange or flanges

project, and provided that the thin edge in the projecting flange or arms of the cross sections does not exceed three-quarters of an inch in thickness. The thickness of the fireproof covering on all surfaces measuring more than three-quarters of an inch wide and measuring in a direction perpendicular to such surfaces shall be not less than that specified for interior columns in the beginning of this section, and all spaces, including channels or chases between the fireproof covering and the metal of the column, shall be filled with a solid fireproof material. Lattice or other open columns shall be completely filled with approved cement concrete.

**Sec. 921. (Foundations.—Steel In.—Concrete Around Bottom of Columns.)**—If steel or iron in any form is used as part of a foundation, it shall be thoroughly imbedded in a concrete, the ingredients of which shall be such that, after proper ramming, the interior of the mass will be free from cavities. The steel or iron shall be entirely enveloped in approved cement concrete, and around the exposed external metal surfaces of such foundation there shall be a covering of approved cement concrete not less than four inches thick.

After the base or base plates and columns have been set in place, both shall be protected from the effects of moisture by a covering of approved cement concrete applied direct to the metal in an unset state, measuring not less than two and one-half inches thick from the extreme projection of the metal, filled solid into all spaces, and forming a continuous concrete mass from the grillage or other foundations to an elevation six feet above the floor level nearest the column base plate or column stool.

**Sec. 922. (Columns.—Wiring Clay Tiles On.)**—Burnt clay tile column covering shall be secured by winding wire around the columns after the tile has all been set around such columns. The wire shall be securely wound around the tile in such manner that every tile is crossed at least once by a wire. If iron wire is used it shall be galvanized, and no wire used shall be less than No. 12 gauge.

**Sec. 923. (Fireproofing.—Protective Covering For.)**—In places where there is trucking or wheeling or other handling of packages of any kind, the lower five feet of the fireproofing of such columns shall be encased in a protective covering either of iron or oak plank, which covering shall be kept continually in good repair.

**Sec. 924. (Pipes Inclosed by Covering.)**—Pipes shall not be inclosed in the fireproofing of columns or in the fireproofing of other structural members of any fireproof building, provided, however, gas or electric light conduits not exceeding one inch inside diameter may be inserted in the outer two inches of the fireproof of such structural member.

**Sec. 925. (Shafts, Etc.)**—In cases where a pipe, conduit, dumb waiter, cable, wire, conveyor, belt or any combination thereof passes from one story to another story through an open hatch or floor opening, a shaft or enclosure of fireproof material shall be built from floor to floor around such hatch or floor opening, in each story above and below such hatch or floor opening in the same manner as described for fireproof partitions in this chapter. The area of space thus inclosed shall not exceed the area of the hatch or floor opening by more than one hundred per centum.

In no case shall any wood be used in the construction or support or fittings of such shaft as described above. If such holes in floors as described above in this section are not enclosed by such fireproof enclosures, then the open spaces in each floor opening not occupied by pipes, conduits, cables, wires, conveyors, belts or any combination thereof, shall be filled solid with fireproof material not less than eight inches thick.

**Sec. 926. (Shafts, Partitions Around, Plastering Of.)**—All burnt clay or terra cotta partitions or walls around shafts having openings in floors shall be plastered on the outside and plastered or pointed on the inside.

**Sec. 927. (Shaft, Doors and Windows.)**—All doors, frames, sashes, casings and windows in partitions or walls around floor openings, or around stair shafts or elevator shafts, shall be built of incombustible material. The supports of such doors, frames, sashes, casings and windows shall also be of incombustible material; in the case of doors, such supports shall be of rolled structural metal extending from floor to ceiling and secured to both. Where there are brick walls of twelve inches or more in thickness the supports need not extend to ceiling as above specified. All glass used in connection with such partitions or walls shall be fire resisting.

Sheet metal work pressed over asbestos paper and wood may be used for the doors, frames, sashes and casings, and for openings in such partitions, except for elevator doors in shafts and where the provisions of this chapter require all metal doors.

Sec. 928. (**Beams and Girders, Coverings Of.**)—The beams and girders of the interior structural parts of a building shall be covered by one of the fireproof materials, so applied as to be supported entirely by the beam or girder protected, and shall be held in place by the support of the flanges of such beams or girders and by the cement mortar used in setting. If metal binding or metal anchors are used as fastenings of such fireproof covering, such metal binding or such metal anchor shall be protected by not less than one-half inch of fireproof covering.

If the covering is of brick it shall be not less than four inches thick; if of hollow tiles or if of solid porous tiles, or if of terra cotta, each of such tiles shall be not less than one and one-half inches thick, applied to the metal in a bed of cement mortar; hollow tiles shall be constructed in such a manner that there shall be one air space of at least three-fourths of an inch by the width of the metal surface to be covered within such clay coverings; the minimum thickness of concrete on the bottom and sides of metal shall be two inches.

The top of all girders and beams shall be protected with two inches of brick or one and one-fourth inches of burnt clay, or two inches of approved cement concrete, or three inches of approved cinder concrete. The brick or burnt clay shall be bedded solid on the metal in cement mortar.

In all cases of beams or girders, in roofs or floors, no matter what the material or form of the floor arch used, the protection of the bottom flanges of the beams and girders and so much of the web of the same as is not covered by the arches shall be made as hereinbefore specified for the covering of beams and girders. In every case the thickness of the covering shall be measured from the extreme projection of the metal, and the entire space or spaces between the covering and the metal shall be filled solid with one of the fireproof materials excepting the air spaces in hollow tile.

Sec. 929. (**Girders and Trusses.**)—All girders or trusses, when supporting loads from more than one story, shall be fireproofed with two thicknesses of fireproof material or a combination of two fireproof materials, as required for exterior columns in Section 912 of this chapter, and each covering of fireproof material shall be bedded solid in cement mortar.

All other girders or trusses supporting only a ceiling or roof shall be covered with a fireproof covering as specified for beams and girders in Section 928 of this chapter.

Sec. 930. (**Cut-Out Boxes, Chases, Etc.**)—No electric service cut-out box, switch box, cabinet, chase or any other recess, shall encroach on the minimum thickness required for any fireproof covering on structural metal, except as provided in Section 924 of this chapter. If the depth of any cut-out box, switch box, cabinet, or chase, or of any other recess, is to be concealed or partially concealed, then the thickness of the fireproof covering shall be increased correspondingly.

Sec. 931. (**Floor, Construction Of.**)—Brick, hollow tile, porous terra cotta, or approved cement concrete, or approved cinder concrete, shall be used for the construction of floors and roofs of fireproof buildings. Flat arch hollow tile, or flat arch porous clay tile floor arches shall have a height of at least one and one-half inch for each foot of span.

Sec. 932. (**Hollow Tile Flooring.**)—Hollow tile flat arch floor construction having a thickness of only one and one-half inch for each foot of span shall be used only for the minimum floor loads, and the area of burnt clay in the flanges and ribs and webs of the hollow burnt clay tiles shall be proportioned to the safe value of resistance to compression of the materials used, in the most stressed areas of the burnt clay.

Sec. 933. (**Segmental Arches.**)—Segmental arches shall have a rise of at least one inch for each foot of span of arch.

The least thickness of a hollow tile or porous terra cotta segmental arch shall be one-half of an inch per foot of span, but on such hollow tile or terra cotta arch shall be of a thickness less than five inches.

Both flat and segmental arches shall be so constructed that the joints of the same radiate from a common center and there shall be a cross rib for every four inches, or fractional part thereof, in height in each tile block. The skew back of the arches shall be carefully fitted to the beams supporting them, and in addition to the cross ribs there shall also be additional diagonal reinforcing ribs in the skew back. Such arches, whether flat or curved, shall have their beds well filled with cement mortar, and the centers shall not be struck until the mortar has set.

Burnt clay skew backs shall be molded in such a manner as to support the burnt clay covering on the under sides of beams or girders.

Sec. 934. (**Floors, Wood Surfacing and Nailing Strips.**)—Wood floor surfacing and wooden nailing strips for such wood floor surfacing may be used in fireproof buildings.

Where wood flooring is used in a fireproof building, the space immediately under such wood flooring, and between the wood nailing strips and under such wood nailing strips, shall be filled with a cement or a cinder concrete tamped into place in an unset state, or such other incombustible material as shall be approved by the Commissioner of Buildings.

**Sec. 935. (Partitions in Fireproof Buildings.)**—The partitions around stairs, stair halls, shafts, elevators or public lavatories shall be fireproof partitions, as described in Section 936 of this chapter; all other partitions in fireproof buildings shall be incombustible partitions. Where blocks are used for building partitions or as enclosing walls the joints shall be well filled with mortar.

The partitions shall be wedged tight between floors and ceilings with incombustible wedges.

**Sec. 936. (Partitions, Fireproof.)**—Only fireproof material shall be used for fireproof partitions; if of brick, they shall be not less than four inches thick, and if of partition blocks, not less than three inches thick. If fireproof partitions are of reinforced concrete they shall be not less than two inches thick.

All fireproof partitions shall be supported directly by the steel construction, or by the fireproof floor arches, or stone concrete, or brick. No cinder concrete or wood flooring shall intervene between any such partition and its support.

All doors, windows, sashes, frames, casings and glass in fireproof partitions shall be built as required in Section 927 of this chapter.

**Sec. 937. (Partitions, Incombustible.)**—Only fireproof or incombustible material shall be used in the construction of incombustible partitions, excepting that frames, casings, doors, sash and the rough carpenter work required for the proper fastenings of such frames, casings, doors or sash, may be of wood, and that ordinary glass may be used in doors and partition windows.

**Sec. 938. (Stairs, Landings.)**—Stairs in fireproof buildings shall be built of approved cement concrete, reinforced concrete, stone or with metal supports, metal strings, metal treads, metal platforms, or a combination of one or more of such materials.

If reinforced concrete is used in the construction of any stairs in a fireproof building, such stairs shall be designed according to the provisions of the sections applying to reinforced concrete.

Stairs shall carry a live load of not less than one hundred pounds per square foot on treads and landings, and every part of a stair shall be so designed that the safe limit of fiber stress is not exceeded.

The hand rails of such stairways may be of wood, all other material in such stairways in fireproof buildings shall be "fireproofed," or "incombustible" material, except cinder concrete.

If stairs are constructed of solid concrete, having the tread and riser in one piece, then there shall be not less than forty-five square inches of concrete in the cross section of such combined tread and riser, and such stairs shall have reinforced concrete or metal outer strings.

If stone treads or platforms are used they shall have a metal sub-tread, or sub-platform, of the same weight as if the metal alone were used.

If platforms have a floor arch sub-construction as described in Section 931 of this chapter, then the metal sub-platform may be omitted.

**Sec. 939. (Painting.)**—All structural metal which is used in a fireproof building, or which is used in any foundation, or which is used in reinforced concrete work, shall be clean and free of rust, or scale at the time of the enclosure or covering of such metal. All metal which is not to be fireproofed shall have two coats of first-class metal protecting paint.

**Sec. 940. (Rivets, Machine Driven.)**—All structural steel and iron work shall be so riveted that the distance from the center of the rivet hole to the edge of the materials shall be not less than:

$\frac{5}{8}$  inch for  $\frac{1}{2}$ -inch rivets.

$\frac{7}{8}$  inch for  $\frac{5}{8}$ -inch rivets.

$1\frac{1}{4}$  inches for  $\frac{3}{4}$ -inch rivets.

$1\frac{3}{4}$  inches for  $\frac{7}{8}$ -inch rivets.

Wherever possible, however, the distance from the rivet hole to the edge of the material shall be equal to two diameters of such rivet hole. All rivets, wherever practicable, shall be machine driven; the rivets in connection shall be proportioned and placed to suit the stresses, and the pitch of rivets shall never be less than three diameters of the rivets nor more than six inches. All holes shall be punched accurately, so that upon assembling a cold rivet will enter the hole without

straining the material by drifting. The rivets shall fill the holes completely, and, whenever necessary, gussets shall be provided of thickness and size to accommodate the number of rivets necessary to make a connection.

Sec. 941. (**Truss Designs to Be Submitted.**)—When steel or iron trusses are used the trusses shall be of such design that the stress in each member may be calculated and all trusses when placed shall be held rigidly in position by an efficient system of lateral and sway bracing, and any member of a truss subjected to transverse stress in addition to direct tension or compression shall have the stress causing such strain added to the direct stresses coming on the member, and the total stresses shall in no case exceed the stresses provided for in Section 1004 of this chapter.

Sec. 942. (**Trusses to Be Inspected.**)—On all buildings in process of construction, where the plans call for the use of trusses, or iron and steel structural work, the erection of such iron and steel structural work and of such trusses shall be inspected thoroughly by an inspector from the Building Department of the city, and such inspector shall be a man well versed in the design and construction of structural steel and iron work, and it shall be the duty of such inspector to see that the provisions of this chapter are strictly complied with, and such inspector shall have the authority to compel the contractors and builders to use a sufficient amount of temporary bracing or guys necessary to insure the safety of the work during its erection and to compel such contractors and builders to keep all derricks, tackles and hoisting appliances used in such work in a safe condition and to enforce all the provisions of this chapter.

Sec. 943. (**Bolts to Be Turned and Holes to Be Reamed.**)—Wherever it is found impossible to rivet connections as herein described and such connections are bolted, the bolts shall be turned and the holes reamed so as to get a perfect fit.

All structural members which are temporarily bolted together shall be well bolted in every alternate hole.

Sec. 944. (**Fireproof Buildings, Height Of.**)—The height of a fireproof building shall be measured from the average inside grade line of the street frontage of the building to the top of the highest point of the external bearing walls. Roof houses for elevators, or tanks, or skylights, or stairs, or scuttles may be built above the height of the main roof, and no building shall be erected in the city of greater height than two hundred and sixty feet.

Sec. 945. (**Roofs, Rise of Roof Above Limit of Height.**)—In the case of buildings which are entirely fireproof in their construction, and of which the roof is also entirely of fireproof construction, the roof may rise above the limit of height of wall fixed by this chapter for such buildings at a slope not to exceed thirty degrees with the horizon, and to a height not exceeding twenty feet above such limitation of the height of such wall. The space enclosed by such roof above the limitation of the height of such wall may be used as an enclosure for pipes, ventilating or elevator machinery or for ventilating ducts, but it shall not be lawful to use such space for purposes of storage, business or residence.

Sec. 946. (**Sheet Metal Work, Support Of.**)—Wood shall not be used as the support of any sheet metal work or of any gutter or cornice of a building more than one hundred feet in height.

Sec. 947. (**Reinforced Concrete.—Regulations in Regard to the Use Of.**)—The term "reinforced concrete," as used in this ordinance, shall be understood to mean an approved concrete mixture reinforced by steel of any shape, so combined that the steel will take up the tensional stresses and assist in the resistance to shear.

Sec. 948. (**Stress.**)—Reinforced concrete construction shall be of such nature that the stresses can be calculated according to the accepted formulas of modern concrete engineering practice.

Sec. 949. (**Permission to Erect.**)—Before permission to erect any reinforced concrete structure is issued, complete drawings and specifications shall be filed with the Commissioner of Buildings, showing all details of the construction, the size and position of all reinforcing rods, stirrups, etc., and giving the composition of the concrete.

Sec. 950. (**Concrete.—Mixing Of.—Method of Testing.**)—The concrete shall be mixed in the proportion of one of cement, three of sand and five of stone, gravel or slag. The proportions shall be such that the resistance of the concrete to crushing shall not be less than two thousand pounds per square inch after hardening for twenty-eight days. The tests to determine this value shall be made by a competent engineer under the direction of the Commissioner of Buildings. The concrete used in reinforced concrete construction shall be what is usually known as a wet mixture.

Sec. 951. (**Cements.—Method of Testing.**)—Only high-grade Portland cements shall be used in reinforced concrete construction. Such cements, when tested neat,

shall, after one day in air, develop a tensile strength of at least two hundred pounds per square inch; and after one day in air and six days in water shall develop a tensile strength of at least five hundred pounds per square inch; and after one day in air and twenty-seven days in water shall develop a tensile strength of at least six hundred pounds per square inch. Other tests as to fineness, constancy of volume, etc., made in accordance with the standard method prescribed by the American Society of Civil Engineers' Committee, may from time to time be prescribed by the Commissioner of Buildings.

Sec. 952. (**Sand.—Torpedo.**)—The sand to be used in such concrete shall be clean, sharp torpedo sand, free from loam or dirt.

Sec. 953. (**Stone, Crushed Slag or Gravel.**)—The stone used in such concrete shall be clean, crushed stone or gravel, or crushed blast furnace slag of a size that will pass through a three-quarter-inch ring. The stone shall be fresh broken and the gravel shall be thoroughly washed.

Sec. 954. (**Steel.**)—The steel used shall be calculated according to its elastic limit; for moving or vibrating loads a steel of a lower elastic limit than is used for quiescent loads shall be used.

Sec. 955. (**Reinforcing.—Method Of.**)—All reinforcing steel shall be completely enclosed by the concrete, and such steel shall nowhere be nearer to the surface of the concrete than the diameter of such reinforcing steel bar, or rod or other shape. The steel in beams or girders shall be so disposed that there shall be not less than one and one-half times the thickness of the steel in concrete between the steel, and where more than two bars are used the bars shall be placed in two or more planes. Reinforced concrete shall be so designed that the stresses in the concrete and the steel shall not exceed the following limits: Extreme fiber stress on concrete in compression, five hundred pounds per square inch; shearing stress in concrete, seventy-five pounds per square inch; concrete in direct compression, three hundred and fifty pounds per square inch; tensile stress in steel, one-third of the elastic limit; shearing stress in steel, ten thousand pounds per square inch.

The adhesion of concrete to steel shall be assumed to be seventy-five pounds per square inch of surface where bars are three-quarters of an inch or less in diameter and proportionately less for bars of a diameter greater than three-quarters of an inch.

The ratio of the moduli of elasticity of concrete and steel shall be taken as one to twelve.

The following assumption shall guide in the determination of the bending moments due to external forces: Beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor plates, when constructed continuous and when provided with reinforcement at top of plate over the supports, may be treated as continuous beams, the bending moment for uniformly distributed loads being taken at not less than  $W. L.$  divided by eight; the bending moment may be taken at  $W. L.$  divided by twenty in the case of square floor plates which are reinforced in both directions and supported on all sides. The floor plate to the extent of not more than five times the width of any beam or girder may be taken as part of that beam or girder in computing its moment of resistance.

The moment of resistance of any reinforced concrete construction under transverse loads shall be determined by formulas based on the following assumptions:

(a) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid.

(b) The strain in any fiber is directly proportionate to the distance of that fiber from the neutral axis.

(c) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in this chapter.

From these assumptions it follows that the stress in any fiber is directly proportionate to the distance of that fiber from the neutral axis.

The tensile strength of the concrete shall not be considered.

Sec. 956. (**Construction.—Reinforced Concrete.**)—Reinforced concrete construction shall be designed so that the shearing stresses, both vertical and horizontal, developed in any part of the construction, shall not exceed the safe working strength of the concrete as fixed in this chapter, or a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome.

When the safe limit of adhesion between the concrete and steel is exceeded, some provision shall be made for transmitting the strength of the steel to the concrete.

952 to 954—548, 955 to 956—549 to 550

# CORRUGATED STEEL BARS

## FOR REINFORCED CONCRETE

Give 20 to 50 per cent more efficiency than any other mechanical bond bar on the market

Given only Gold Medal highest award by both juries  
Louisiana Purchase Exposition for reinforcing bars

Also Gold Medal, Lewis and Clark Centennial Exposition, Portland

Cement Basements and Walks

Reinforced Concrete

**Sec. 957. (Columns.—Reinforced Concrete.)**—Reinforced concrete may be used for columns when the ratio of length to the least side or diameter does not exceed twelve. The reinforcing rods shall be tied together at intervals of not more than the least side or diameter of the column, or spirally wound steel may be used.

When vertical reinforcing rods are used in columns, such rods shall have their ends milled normal to the longitudinal axis, and such rods shall have full perfect bearings at each joint, and such joints shall occur only at floors or other points lateral support and a tight fitting sleeve shall be provided at all joints of vertical reinforcing rods.

**Sec. 958. (Wind Pressure.)**—In the case of buildings in which allowances must be made for wind pressure as provided in Section 1013 of this chapter, the reinforcing rods of columns shall be connected and the milled end surfaces shall be brought together by threading the rods and by threaded sleeve nuts, or threaded turnbuckles, or methods equally effective and satisfactory to the Commissioner of Buildings.

**Sec. 959. (Tests.—To Be Made by Contractor on Demand.)**—The contractor shall be prepared to make load tests on any portion of a reinforced concrete construction within a reasonable time after erection, as often as may be required by the Commissioner of Buildings. Such tests shall show that the construction will sustain a load twice that for which it is designed, without any sign of failure, or in the case of beams, girders or floors, without deflecting more than one-seven-hundredths of the span.

**Sec. 960. (Reinforced Concrete Walls.)**—Buildings of Classes I., II., III., VI. and VII. having a complete skeleton construction of steel or of reinforced concrete construction or a combination of both, designed to safely resist all of the strains caused by the dead weights of the structure and of the live loads and of the wind pressure within the safe limits of stress provided in this chapter for each material used, may have walls of reinforced concrete six inches thick for the upper two stories and walls seven inches thick for the two stories next below the upper two stories, and walls eight inches thick for the stories next below the upper four stories, and walls nine inches thick for the stories next below the upper six stories, and so on downwards, increasing the thickness of the walls one inch for each two stories or part thereof. Provided, however, that such walls shall support only their own weight, and that such walls have steel rods three-quarters of an inch in diameter or of an equivalent area set vertically, and spaced not more than eighteen inches apart, and steel rods five-eighths of an inch in diameter or of an equivalent area set horizontally tied to the vertical rod at each intersection with these, and set not to exceed twenty-four inches apart; and provided that where the weight of the walls of each story is not transferred to the skeleton by spandril beams, the vertical reinforcement shall be increased in weight in an arithmetical ratio of twice as much steel in the two stories next below the upper two stories, and three times as much steel in the two stories next below the upper four stories, and so on downward. Vertical bars shall be spliced together by winding with iron wire. Horizontal bars shall be wired to the columns. Additional bars shall be set around openings, the verticals wired to the nearest horizontal bars and the horizontal bars at top and bottom of openings shall be wired to the nearest vertical bars.

The steel rods shall be combined with the concrete and placed where the combination will develop the greatest strength, and the rods shall be staggered or placed and secured to the steel or reinforced concrete structural skeleton of the building, so as to resist a pressure of fifty (50) pounds per square foot, either from the exterior or from the interior on each and every square foot of each wall panel.

**Sec. 961. (Molded Hollow Concrete and Hollow Tile Block.)**—Molded hollow concrete blocks or molded hollow vitrified clay building blocks of the full thickness of a ten-inch wall may be used wherever eight-inch walls are called for by this chapter, and such blocks may also be used wherever twelve-inch brick walls are called for in this chapter under frame cottages and in one and two story Class III. and Class VI. buildings.

## ARTICLE XIII.

### SLOW-BURNING CONSTRUCTION.

**Sec. 962. (Slow-Burning Construction Defined.)**—The term "slow-burning construction" shall apply to all buildings in which the structural members which carry the loads and strains which come upon the floors and roofs thereof are made wholly or in part of combustible material, but throughout which the structural metallic members shall be protected against injury from fire by coverings of incombustible, non-heat conducting material similar to those described under the head of "skeleton construction," except that plastering and metallic lath may be used as provided

957 to 962—551 to 556

herein. In the case of columns the metallic lath shall be fastened to metallic furrings and the plastering upon the same shall be of three coats of mortar. The lower five (5) feet of each column shall be protected as required for brick, concrete or tile covering in Section 923 of this chapter. A covering of three (3) coats of plastering on metallic laths shall be considered sufficient protection for the under side of joists and girders and a layer of mortar or other incombustible material at least 1½ inches thick shall be applied on all floors and roof surfaces above the joists of the same.

Sec. 963. (**Posts, Partitions and Elevator Enclosures.**)—Where oak posts of greater sectional area than one hundred square inches are used, they need not be covered. All partitions and all elevator enclosures in buildings of this type shall be made entirely of incombustible material. The use of wood furring or of stud partitions shall not be allowed in buildings of this type.

Sec. 964. (**Stairs.—To Be Incombustible.**)—Where buildings are required by this chapter to be of "slow-burning construction," all stairs in such buildings shall be of incombustible material.

#### ARTICLE XIV.

#### MILL CONSTRUCTION.

Sec. 965. (**Mill Construction Defined.**)—The term "mill construction" shall apply to all buildings in which all the girders and joists supporting floors and roof have a sectional area of not less than seventy-two square inches, and above the joists of which there is laid a timber floor not less than three and three-fourths inches thick. Wooden posts used in buildings of this type shall not be of smaller sectional area than one hundred square inches.

Sec. 966. (**Fireproofing.**)—Partitions and elevator enclosures in buildings of this type shall be made entirely of incombustible material. If iron columns, girders or beams are used in buildings of this type, they shall be protected as specified in Section 946 of this chapter, but the wooden posts, girders and joists need not be protected by fireproof covering. The use of wood furring, wood laths or stud partitions shall not be permitted in buildings of this type.

Sec. 967. (**Stairs.—To Be Incombustible.**)—Where buildings are required by this chapter to be of "mill construction" all stairs in such buildings shall be of incombustible material.

#### APPROVED CINDER CONCRETE CONSTRUCTION.

Sec. 968. (**Concrete Construction.—Approved Cinder.**)—The term "approved cinder concrete construction" shall apply to all buildings in which all parts that carry weights or resist strains, all exterior walls, all interior walls, all interior partitions, all stairs and all elevator enclosures are made entirely of incombustible material, and in which all metallic structural members are protected against the effects of fire by approved cinder concrete proportioned, mixed, applied and secured as herein described. Approved cinder concrete construction may be used for all buildings in which fireproof construction is mandatory by this chapter, or where ordinary construction may be used.

Sec. 969. (**Concrete.—Cinder.—Approved.**)—Approved cinder concrete shall consist of a standard Portland cement, torpedo sand, and clean, thoroughly burnt steam boiler cinders, free from deleterious matter, no particle of which shall be larger than one inch.

Sec. 970. (**Cinders.—Quantity.**)—The volumetric quantity of the cinders combined with the torpedo sand shall not exceed the volume of the Portland cement by eight (8) times. All of the ingredients of approved cinder concrete shall be thoroughly worked and wet so as to cover each piece of cinder with moistened cement; and the cement and sand shall fill all of the voids between the cinders.

All approved cinder concrete shall be cast and rammed in an unset condition against the metal.

The minimum thickness of approved cinder concrete covering in structural metal shall be two (2) inches. In every case the thickness of the coverings shall be measured from the extreme projection of the structural metal unless otherwise provided in this chapter.

Sec. 971. (**Columns Approved.—Concrete Coverings.**)—The approved cinder concrete covering of the columns shall be not less than three (3) inches in thickness from the extreme projection of the metal, including the plastering, and in all cases the cinder concrete shall be rammed solid against the column metal, filling all channels and open spaces within the perimeter of the finished plaster column. Approved

cinder concrete column covering shall have metal binders of No. 8 gauge wire imbedded in and around the columns for each sixteen (16) inches in height of the column, provided, however, that in buildings of approved cinder concrete construction the columns may be covered with one thickness of metal, furring metal, metal lathing and not less than three coats of mortar.

In places where there is trucking or wheeling, or handling of packages of any kind, the lower five (5) feet of every column shall be incased in a protective covering such as is described in Section 923 of this chapter.

**Sec. 972. (Beams and Girders.—Approved Cinder Concrete Construction.)**—The beams and girders of a building built of approved cinder concrete construction shall be enclosed in approved cinder concrete which shall be not less than two (2) inches in thickness at any and all points of the structural metal work. The approved cinder concrete covering shall be reinforced with metal clips or wire binders, either or both of which shall not be more than sixteen (16) inches on centers in the direction of the length of the structural member.

The top of all girders or beams shall be protected with not less than two (2) inches of approved cinder concrete.

A floor or roof construction of approved cinder concrete may be used for any span between structural members that will carry the test loads required by this chapter for such floors and roofs.

**Sec. 973. (Segmental Arches.)**—Segmental arches shall be not less than three (3) inches in thickness at the crown.

**Sec. 974. (Floors.—Flat Slab Construction.)**—Flat slab construction shall be not less than four (4) inches in thickness for spans of eight (8) feet or less. Flat slab floor construction shall be not less than five (5) inches in thickness for spans between eight (8) and ten (10) feet.

Approved cinder concrete shall not be used as a floor or roof construction unless such approved cinder concrete is reinforced by steel or iron, and such reinforcement shall not weigh less than three-quarters of a pound per square foot of superficial surface.

All reinforcing steel shall be completely enclosed by the concrete.

Wood nailing strips for floor surfacing may be used in buildings of approved cinder concrete construction, provided, however, that such nailing strips shall be imbedded as described in Section 934 of this chapter.

**Sec. 975. (Partitions.)**—The partitions in buildings of approved cinder concrete construction shall be as described in Section 935 of this chapter for partitions in fireproof buildings, provided, however, that partitions may be built wholly of metal studding, metal lath and plaster, but no such partitions shall be of a less thickness than one and one-half (1½) inch.

The partitions around stairs, or stair halls, or shafts, or elevators, or public lavatories, shall be wedged tight between the structure of the floors and ceilings, or if such partitions are of plaster, the metal or metal studding shall be secured to the structure by clips, bolts or other metal fastening, and in no case shall any such partition be built on the wood flooring or wood nailing strips.

**Sec. 976. (Walls.—Enclosing.)**—The enclosing walls, the covering of exterior side of mullions, beams, girders, lintels, the enclosures of pipes, pipe shafts, the doors into shafts, windows into shafts, covering of girders, covering of trusses, cut-out boxes, chases, stairs, landings, painting, rivets, bolts, and all other items required in these sections on fireproof construction and in the sections on skeleton construction shall, in buildings of approved cinder concrete construction be designed or built or covered, or made of the material called for, or any one or a number of these requirements, as described in such sections describing the requirements of skeleton construction or of fireproof construction in this chapter, provided, however, that approved cinder concrete as described herein may be used for all protective covering of structural metal.

## ARTICLE XV.

### ORDINARY CONSTRUCTION.

**Sec. 977. (Ordinary Construction Defined.)**—The term "ordinary construction," as used in this chapter, means the ordinary system of construction in which timber and iron structural parts are not protected with fire resisting coverings.

972 to 977—565 to 570

**GENERAL CONSTRUCTION REQUIREMENTS.**

Sec. 978. (**Construction or Alteration of Buildings.**)—Every building or structure, or part thereof, hereafter constructed, erected, altered, enlarged or changed anywhere within the city, shall be so constructed, erected, altered, enlarged or changed only in accordance with the provisions of this chapter.

Sec. 979. (**Materials.**)—Materials used in the construction of buildings of all classes shall conform to the following specifications:

Sec. 980. (**Foundation Proportions.**)—Foundations shall be proportioned to the actual average loads they will have to carry in the completed and occupied building.

Sec. 981. (**Foundation Construction.**)—Foundations shall be constructed of either of the following: Approved cement concrete, dimension or rubble stone, sewer or paving bricks or iron or steel or piles. If iron or steel is used the filling and the coating of the same shall be of Portland cement as provided in Section 992 of this chapter, piles shall be covered with grillage of timber, concrete or steel, or a combination of these. Where timber grillage or timber piles are used, the top of such grillage or such piles shall be at least one foot below city datum.

Sec. 982. (**Foundation of New and Old Walls.**)—In all cases where there is an increase in the thickness of walls, a new foundation shall be built in such manner as to carry jointly both the new and old walls, and the soil under such foundations shall not be loaded beyond the limits hereinbefore specified in this chapter. All foundations shall be protected against the effects of frost, and frozen cement mortar shall not be used in connection with building operations.

Sec. 983. (**Foundations.—Pile Borings Required.—Safe Load Required.—Fiber Stress.**)—Where pile foundations are used, auger borings of the soil shall first be made to determine the position of the underlying stratum of hard clay or rock, and the piles shall be made long enough to sustain the required load according to approved formulas for pile driving, and timber piles shall not be loaded more than twenty-five tons to each pile. The heads of the piles are to be protected against splitting while they are being driven, and after having been driven the piles are to be sawed off to a uniform level and covered with a grillage so proportioned that in the transmission of the load from the structure to the pile the extreme fiber stress of the grillage shall not exceed the safe limits for the respective materials as prescribed in this chapter. The safe compression load per square inch on concrete in concrete piles shall not exceed four hundred pounds. The area of the cross section shall be measured at a point six (6) feet below the head of the pile after the same has been set in place, and the cross section of the pile above this point shall not be reduced.

Sec. 984. (**Foundations Other than Pile.**)—If foundations of other materials than piles are used, they shall be so proportioned that the loads upon the soil shall not exceed the limits for different kinds of soil than those hereafter given, to-wit:

Sec. 985. (**Load for Various Soils.**)—If the soil is a layer of pure clay at least fifteen feet thick, without admixture of any foreign substance excepting gravel, it shall not be loaded more than at the rate of three thousand five hundred pounds per square foot. If the soil is a layer of pure clay at least fifteen feet thick, and is dry and thoroughly compressed, it may be loaded not to exceed the rate of four thousand five hundred pounds per square foot.

Sec. 986. (**Load for Sand Fifteen Feet Thick.**)—If the soil is a layer of dry sand fifteen feet or more in thickness, and without admixture of clay, loam or other foreign substance, it shall not be loaded more than at the rate of four thousand pounds per square foot.

Sec. 987. (**Load for Mixed Soil.**)—If the soil is a mixture of clay and sand it shall not be loaded more than at the rate of three thousand pounds per square foot.

Sec. 988. (**Foundations in Wet Soil.—Trenches to Be Drained.**)—In all cases where foundations are built in wet soil, it shall be unlawful to build the same unless the trenches in which the work is being executed are kept free from water by bailing, pumping or otherwise, until after the completion of work upon the foundations, and in each case a connection with the street sewer shall be established before beginning the work of laying foundations.

Sec. 989. (**Foundations.—Where Not Permitted.**)—Foundations shall not be laid on filled or made ground or on loam, or on any soil containing admixture of organic matter.

**Sec. 990. (Foundations.—Depth Below Surface.—Least Limit.—Depth Regulated by Sewer.—Exceptions.)**—Foundations shall in all cases extend at least four feet below the surface of the ground upon which they are built, and in the case of all buildings forty feet or more in height, foundations shall extend at least to the depth drained by the street sewer in the neighboring streets or alleys; but if such sewers are at a greater depth than ten feet below the sidewalk grade, such foundations need not extend to a greater depth than ten feet, provided that sound, hard soil is found at that depth.

**Sec. 991. (Concrete.—Broken Stone.—Sand.—Cement.—Mortar.—Foundations Of.)**—Broken stone or concrete in making foundations shall be clean and free from dirt and dust. And sand shall be free from admixture of loam and shall be otherwise clean and sharp.

Cement shall have been kept dry and shall be used fresh from the package; cement which has been permitted to become wet, hard or lumpy before it is mixed into the mortar or concrete shall not be used.

The use of concrete or mortar of any kind, the ingredients of which are not thoroughly and completely mixed and which are not free from lumps, or other unmixed portions of any of the ingredients, is prohibited; and also the use of cement mortar which has become partly or wholly set before use. Concrete foundations wherever used shall have boxes of plank all around them, and the concrete shall be well rammed in individual layers not more than six inches each in thickness. The ramming shall be continued until the water stands on the top of the mass of concrete.

**Sec. 992. (Steel Rails or Beams in Concrete.)**—If steel or iron rails or beams are used as parts of foundations, they shall be thoroughly imbedded in a concrete, the ingredients of which shall be such that after proper ramming the interior of the mass will be free from cavities, the beams or rails shall be entirely enveloped in concrete, and around the exposed external surfaces of such concrete foundations there shall be a coating of a standard cement concrete not less than four inches thick.

**Sec. 993. (Concrete Foundations.—Steps.—Safe Load Where Reinforced by Beams.)**—If concrete foundations are used by themselves and without the insertion of iron or steel beams or rails, the offset on top of same shall not be more than two-thirds the height of the respective courses, and such concrete foundations shall not be loaded more than twenty-five thousand pounds per square foot. If reinforced by iron or steel beams or rails, the loads and offsets in the same shall be so adjusted that the fiber stress upon the metal, if iron, shall not exceed twelve thousand pounds per square inch, or, if steel, that the fiber stress shall not exceed sixteen thousand pounds per square inch.

**Sec. 994. (Dimension Stones.—Safe Load.)**—Dimension stones shall have uniform beds and the offsets in the same, where two or more layers are used, shall not be more than three-quarters of the height of the individual stones. They shall be set with full beds of cement mortar under their entire area, and in such manner that they will not rock after being set. Dimension stones in foundations shall not be subjected to a load of more than twenty thousand pounds per square foot in tiers.

If the beds of the stones are dressed and leveled off to a uniform surface and the stones are set in a standard cement mortar, this strain may be increased to twenty-five thousand pounds per square foot.

**Sec. 995. (Rubble Stone.)**—Rubble foundations and rubble walls shall be built of approximately square and flat bedded stones, well and thoroughly bonded in both directions of the walls, each stone thoroughly bedded in mortar under its entire area. Wherever walls of any kind are used as curb walls, their exterior surfaces shall be rendered approximately water tight by a coating of a standard cement mortar.

**Sec. 996. (Brick.—Soft.—Use Of.—Bond.—Safe Load.)**—The use of soft bricks is prohibited in all parts of buildings exposed to the weather and in internal or external piers or bearing walls. The bond of brick work shall be formed by laying one course of headers for every five courses of stretchers. Brick work in walls laid in a standard Portland cement mortar shall not be loaded more than twenty-five thousand pounds per square foot. Brick work laid in an ordinary cement mortar shall not be loaded more than eighteen thousand pounds per square foot. Brick work in walls laid in lime mortar shall not be loaded more than thirteen thousand pounds per square foot.

**Sec. 997. (Walls.—Ledges.—Joists Supports.)**—Whenever walls sixteen inches or less in thickness shall be used for the support of ordinary joists in buildings of all classes, ledges of the thickness of the furring, lath and plaster shall be formed between such joists and shall be carried up and leveled off on the line of the tops of the joists, or standard cast iron joist boxes shall be used for the support of such joists.

Sec. 998. (Walls Around Stairs, Elevators and Shafts.)—Where a stairway or an elevator shaft or an air shaft is surrounded by brick walls, such surrounding brick walls may be built sixteen (16) inches thick, excepting that the upper fifty (50) feet of the height may be built twelve (12) inches thick, but the length or breadth, or either, of such a stairway or elevator shaft or air shaft shall not exceed twenty-five (25) feet, and in no case shall the load on the brick of such wall or walls exceed the safe limits of load specified for brick work in this chapter.

Sec. 999. (Pressed Brick Facing.—Bond Joints.)—If pressed brick facings are used, they shall be bonded into their backing every seventh course. Bond shall be established by solid headers or by blind headers. In the case of piers faced with pressed brick, only solid headers shall be used, but bond stones or iron bond plates may be substituted for such headers. Pressed brick in all cases shall be so laid as to have a full bed of mortar under its entire surface. The laying of pressed brick merely with a joint all around the outer edge of the bricks shall be unlawful.

Sec. 1000. (Brick Piers.—Offsets.—Bond Stone.—Cap Stone.)—In building brick piers there shall be provided at every offset in each pier, or at every point where such brick pier receives the load, a bond stone at least eight inches thick or a plate of rolled iron or steel not less than one-fourth of an inch in thickness, which stones or plates, if at the top of such pier, shall cover its entire surface, and shall in all cases be adapted to receiving the load to be imposed and shall be made of a strength which will keep the fiber strain upon the material used within the limits elsewhere herein stated.

Sec. 1001. (Stone Facing Without Bond Courses.)—Stone may be used as facing for brick walls under the following conditions: If the facing is ashlar, without bond courses, and the individual course thereof measure in height between bond stones more than six times the thickness of the ashlar, then each piece of ashlar facing shall be united to the brick work with wrought iron anchors at least two to each piece and reaching at least eight inches over the brick wall, and hooked into the stone facing as well as the brick backing. Wherever ashlar as before described is used, it shall not be counted as forming part of the bearing surface of the wall, and the brick backing shall be of the thickness of wall herein specified for the different kinds of building.

Sec. 1002. (Stone Facing with Bond Courses.)—If stone facing is used with bond courses at a distance apart of not more than four times the thickness of the ashlar, and where the width of bearing of the bond courses upon the backing of such ashlar is at least twice the thickness of the ashlar, and in no case less than eight inches, then such ashlar facing shall be counted as forming part of the wall and the total thickness of wall and facing shall not be required to be more than herein specified for walls of the different classes of buildings.

Sec. 1003. (Stresses.—Cast Iron.—Fiber.—Strains.—Length.)—The stresses in materials used in construction produced by the calculated strains due to their own weight and applied loads shall in no case exceed the following:

**CAST IRON.**

Extreme fiber strain tension..... 2,500 lbs.  
 For columns ..... 10,000 lbs.  
 Reduced by Gordon's formula. Reduced for eccentric load.  
 No cast iron column shall have a length to exceed twenty-four times its diameter, or least side.

**Sec. 1004. STRESSES IN POUNDS PER SQUARE INCH.**

	Wrought Iron.	Steel.
Extreme fiber stresses, "I" beams and shapes.....	12,000	16,000
Extreme fiber stresses, built beams.....	10,000	15,000
Tension .....	12,000	15,000
Shearing .....	7,500	10,000
Direct bearing pins and rivets.....	15,000	20,000
Bending on pins .....	18,000	22,500
*For columns and compression members.....	12,000	15,000

\*Reduced for ratio of length of columns to its least radius of gyration by approved modern formulas, and reduced for eccentric loading.

Sec. 1005. **TIMBER—STRESSES IN POUNDS PER SQUARE INCH.**

	On Extreme Fiber	Compression Per-	
		Shearing Along Grain	pendicular to Grain
White Pine and Spruce.....	750	80	150
White Oak .....	1,000	150	250
Long-leaved Yellow Pine .....	1,250	100	250

Sec. 1006. **(Posts with Flat Ends.—Stresses per Square Inch.)—**

- L. Length of posts in inches.  
D. Least side or diameter of post in inches.  
S. Stress per square inch.

White Pine Spruce.		L. L. Yellow Pine.		White Oak.
L. D.	S.	L. D.	S.	S.
0-10	625	0-15	1,000	750
10-35	475	15-30	875	650
35-45	375	30-40	750	560
45-50	300	40-45	625	460
		45-50	500	375

Sec. 1007. **(Walls.—Eight-Inch Brick Wall.—Height Limited.)—**In no case, in any class of building, shall any eight-inch brick wall be more than fourteen feet in height.

**GENERAL PROVISIONS.**

Sec. 1008. **(Cement Concrete Walls.—Solid.)—**Approved cement concrete of the same thickness as is required where common brick or rubble stone, may be substituted for either of these materials wherever either is called for in this chapter.

Sec. 1009. **(Walls.—Thickness Of.)—**The thickness of walls set forth in the tables for the various classes of building shall, for each class of buildings, apply to all external enclosing walls, and also to such internal walls as may be required under the specifications of the different classes of buildings.

Sec. 1010. **(Bay Windows and Light Shafts.—Material For.)—**Bay or oriel windows and light shafts may be built of combustible material, as specified in Section 307 of this ordinance.

Sec. 1011. **(Buildings.—Height Of.)—**The limits of heights of buildings hereinbefore given for non-fireproof buildings, shall be from the average established sidewalk level to the highest point of roof thereof.

No buildings shall be erected in the city of greater height than two hundred and sixty feet from the sidewalk level to the highest point of external bearing walls. The erection of parapet walls or of balustrades constructed entirely of incombustible material is permitted above the roof level of buildings of all classes, and in addition to the heights herein fixed for the same. (See Sections 944 and 945.)

Sec. 1012. **(Floor Areas.—Computation Of.—For All Classes of Buildings.)—Stairs in Common.)—**The floor areas of all buildings shall be computed from the dimensions taken on the inner side of the exterior or surrounding walls on the floor of the third story, and the areas of courts, of elevator shafts, of enclosed stairs, if enclosed with incombustible materials, and of chimneys, shall not be considered as a part of such floor areas.

Where two areas of the same building adjoin, and are separated by fireproof dividing walls, they may have a stairway in common. Provided, however, in fireproof buildings such stairways shall be of incombustible material, enclosed in fireproof partitions, and access to such stairway shall be direct from each such area. Provided, however, in buildings of mill, slow-burning or ordinary construction, such stairways shall be of incombustible materials, enclosed by brick walls, and that doors to such stairways shall be automatic, self-closing standard iron doors, as described in Section 110 of this chapter, and all materials inside of such brick walls shall be fireproof or incombustible material.

Sec. 1013. **(Wind Pressure.—Precautions Against.)—**In the case of all buildings the height of which is more than one and one-half times their least horizontal dimension, allowances shall be made in both vertical and horizontal construction for wind pressure, which shall not be figured at less than thirty pounds for each square foot of external wall surface.

Sec. 1014. **(Basement.—Meaning Of.)—**Wherever in this chapter the words "basement story" are used, it is intended to mean that the floor of such story is at a distance of two feet or more below the level of the sidewalk, and that its height does

1005 to 1014—595 to 604

not exceed eleven feet in the clear. If the floor of such story is nearer than two feet to the sidewalk grade, or if the ceiling of such basement is more than nine feet above the sidewalk grade, it shall be counted as the first story of the building in which it occurs; except in buildings of Class VI. and Class VIII. as defined in Section 610 of this chapter.

**Sec. 1015. (Cellar.—Meaning Of.)**—Cellar is a story, the height of which is more than two-thirds below the level of the grade at the building.

**Sec. 1016. (Sub-Basements and Cellars.—Construction Of.)**—No building may have more than one basement or cellar of ordinary or slow-burning or mill construction, all additional basements or cellars shall be of fireproof construction, as described in this chapter, all elevator enclosures shall be of brick from the lowest basement floor level to the first story floor, and all stairways shall be enclosed in fireproof partitions from the lowest basement floor level to the first story floor level with automatic closing standard iron doors, opening outward.

In cases where a pipe, conduit, dumb-waiter, cable, wire, conveyor or belt, or any combination thereof passes from one basement to another through a floor the opening in the floor shall be enclosed as specified in Sections 925, 926 and 927 of this chapter.

The number and width of stairs from the lowest basement floor to the first story shall be the same as required for the four highest stories of a building of the same area.

**Sec. 1017. (Enclosures Upon Roofs.—Parapets and Balustrades Upon Roofs.)**—It shall be permitted to erect on the roofs of all buildings more than sixty feet and less than one hundred feet high, skylights, enclosures for water tanks and enclosures for elevator machinery, the construction of all of which enclosures shall be entirely of incombustible material; provided, however, that the roofs of same may be built of mill or slow-burning construction.

**Sec. 1018. (Fire Walls.—When Dispensed With.)**—Fire walls of brick not less than twelve inches thick shall be built extending above the roofs of buildings if such roofs are flat, and also above the roofs of all buildings where the same abut against another building, or where the same stand upon any line of any lot, excepting street or alley lines. Provided, that where eight-inch walls are permitted in the top story of buildings, or as provided in Classes III. and VI. for buildings not over three stories high, the fire walls shall be of the same thickness. Such fire walls, where they stand upon lot lines, or where they are over the dividing walls in the interiors of buildings where such are called for by this chapter, by reason of the great area of such buildings, shall extend at least three feet above the roofs of such buildings. Fire walls upon street and alley lines shall extend not less than eighteen inches above the roofs of such buildings. Fire walls may be dispensed with on street and alley lines if the tops of the roof boards and roof joists are protected against fire for a distance of at least five feet from such street or alley lines by a coating of deafening mortar on hollow tile or porous tile at least two inches thick. Fire walls at street and alley lines may also be dispensed with in all cases where the entire framing and materials of the roof shall be made strictly fireproof.

Walls facing upon courts and light shafts shall be treated as in the same category with walls facing upon streets and alleys.

Fire walls shall be covered with a weatherproof coping of incombustible material.

**Sec. 1019. (Window and Door Sills Incombustible.)**—Window and door sills shall be made of incombustible material. Oak timber used for door sills and not less than eight inches thick by the full width of the wall in which such sills occur, shall, for the purpose of this chapter, be counted incombustible, but no other form or use of wood construction shall be considered incombustible.

**Sec. 1020. (Store Fronts.—Columns and Lintels Supporting.)**—The columns and lintels supporting store fronts in buildings within the fire limits of more than one story in height shall be made of incombustible material.

**Sec. 1021. (Roofs.—Shingle or Gravel.)**—The use of shingle roofs or of other forms of combustible roof covering upon buildings erected or altered within the fire limits is prohibited. Provided, however, that shingle roofs may be placed on buildings not exceeding two stories in height and two thousand square feet in area, but the shingles used on such roofs shall first have been dipped in fire-resisting paint, such fire-resisting paint to be approved by the Commissioner of Buildings.

Roofs whose slope is not more than three inches per foot horizontal, and the covering of which is made with a composition of felt and gravel, shall be considered incombustible under the provisions of this chapter, and may be used upon buildings of all classes.

**Sec. 1022. (Roofs.—Construction Of.—Pitch Of.)**—In the case of all buildings less than sixty feet in height, roofs having a slope of more than that specified for composition roofs, may be made of timber and board construction, and shall be covered with incombustible material, except as provided in Section 1021 of this chapter. The roofs upon buildings sixty or more feet and less than ninety feet high, and of greater slope than three inches to the foot and less slope than thirty degrees with the horizon, shall, if made of timber construction, have an incombustible covering upon the roof boards, which shall be made either of mortar or porous terra cotta or plaster boards, or other incombustible material, and which shall be at least two inches thick. If this covering is made upon the roof boards, wooden strips shall be inserted and securely fastened to the wooden substructure at regular intervals between the incombustible covering, and a weatherproof covering of incombustible material.

**Sec. 1023. (Roofs.—Strength Of.)**—The roofs of all buildings of every kind and class shall be designed and constructed in such a manner that they will bear a load in addition to the weight of their structure and covering of at least twenty-five pounds for each square foot of horizontal surface.

**Sec. 1024. (Roofs.—Pipes Carrying Water From.)**—The water from all roofs shall be carried to the street sewers in metal conductor pipes, which shall be continually maintained in such condition that leaks therein will not cause the water to soak into the walls or any other part of the building.

**Sec. 1025. (Cornices.—Gutters.—Eaves.—Parapets.—Bay Windows.)**—Where sheet metal cornices or external metal sheet gutters are used, their entire framework and covering shall be of metal, and the walls shall extend behind all such cornices or gutters along their entire height. All metal work in and about any cornice, gutter, eave or parapet, or in or about any bay, or oriel window, shall be supported by suitable brackets placed not more than four feet apart and firmly secured to the wall. Wood shall not be used as the support of any gutter or cornice for buildings of one hundred feet or more in height.

**Sec. 1026. (Towers.—Domes and Spires.—Construction Of.)**—Towers, domes and spires may be built on top of the roofs of buildings, but shall not occupy more than one-fourth of the street frontage of any building. Such towers, domes or spires, if any part thereof is built to a height of more than sixty feet and less than ninety feet, shall be of slow-burning construction, and if of greater height than ninety feet above the sidewalk shall be of fireproof construction; and in all cases where the area of such spire, dome or tower exceeds one hundred square feet, its supports shall be carried down to the ground, and shall be, if the construction supported is more than sixty feet and less than ninety feet high, of slow-burning construction, and if more than ninety feet high, of fireproof construction.

**Sec. 1027. (Skylights.—Construction Of.—Glass In.)**—Any skylight on the roof of any building, other than a frame building, shall have the sides, sashes and frames constructed of metal; or of wood, metal clad on all exterior surfaces.

The glass in all such skylights, except in buildings of Classes III. and VI. not exceeding three stories in height shall have at least six inches over same, a strong wire netting (wire not lighter than No. 8 and mesh not coarser than one and one-half inch by one and one-half inch), unless the glass contains a wire netting within itself.

**Sec. 1028. (Porches.—Verandas.—Porticos.—Balconies.—Construction of Inside Fire Limits.)**—If verandas, porches or porticos are enclosed, the enclosing walls shall be made of incombustible material, the only exception being in case such porticos or verandas are to be made part of a storm house or of a storm door enclosure, which, however, shall in no case be more than twelve feet high, nor shall it occupy a greater frontage than two feet more than the width of the inner doors for which the storm doors are made.

**Sec. 1029. (Sidewalks.—Occupation of by Parts of Buildings.)**—The use of any part of the sidewalks for steps or for open areas is prohibited.

**Sec. 1030. (Chimneys.—Walls Of.)**—No chimney shall be built with less than four inches thick brick wall, and no chimney having a greater flue area than two hundred and sixty square inches shall have walls less than eight inches thick; provided that in all cases where chimneys are built with walls less than eight inches thick the same shall have flue liners of fire clay or terra cotta in their entire length. Except that where flues are to be used for gas grates or gas ranges only, the flue lining may be omitted, but the inside of the flue shall be smoothly plastered. The use of unprotected metal flues inside of buildings will not be permitted.

**Sec. 1031. (Chimneys.—Height Above Roof.)**—Every chimney having an area of not more than two hundred and sixty square inches shall be carried up to at least five feet above the highest part of the roof of the building of which such chimney is a part, if such roof is a flat roof. If the roof is a pitched roof the chimney shall be carried up at least two feet above the highest point of same.

**Sec. 1032. (Chimneys.—Interior.—Walls Of.)**—Chimneys having a greater flue area than six hundred square inches shall, if built of brick, have surrounding walls of at least sixteen inches of brick work, and such walls shall be built hollow with at least four inches hollow space in such walls, at a height of fifty feet above smoke inlet the thickness of the surrounding brick work may be reduced to twelve inches, but in all cases the surrounding walls of chimneys of this or any other size shall be so proportioned that the brick work in same will not be subjected to a greater stress than elsewhere herein fixed as a maximum safe stress for brickwork. For chimneys having a greater flue area than one thousand six hundred square inches the thickness of walls shall be increased above the thickness above specified, four inches for each increase of one thousand square inches or fractional part thereof.

**Sec. 1033. (Chimneys or Flues.—Height above Roof.)**—All flues having a greater area than two hundred and fifty square inches, and not more than six hundred square inches, shall be carried up at least twelve feet above the highest point of roof or building of which they form part; and all flues having a greater area than six hundred square inches and not more than nine hundred square inches, shall be carried up at least twenty feet above highest point of roof. All chimneys having a greater area than nine hundred square inches shall be carried to a height of at least twelve feet above any roof within a radius of sixty feet; provided that the top of the chimney shall be not less than twenty feet above the highest point of the roof of the building of which it forms a part.

**Sec. 1034. (Chimneys or Flues.—Linings Of.)**—All flues having a greater area than four hundred square inches shall be lined on the inside with insulating material, which lining shall start at least two feet below the smoke inlet, and for flues having an area of from four hundred to six hundred square inches shall extend twelve feet above smoke inlet, and for all flues of more than six hundred square inches, and not more than one thousand six hundred square inches, shall extend twenty feet above smoke inlet, and for all flues having a greater area than one thousand six hundred square inches, shall extend at least thirty feet above smoke inlet. If an internal smoke pipe of metal is used, so much of the brick work as is inside of the insulating cavity of the stack may be omitted. Metal smoke-stacks shall, however, be lined with insulating material for at least thirty feet of their height.

If internal stacks in buildings be made of metal then they shall be entirely surrounded within the building with a fireproof material which shall thoroughly protect the building from fire, and there shall be an air space, not less than four inches in the smallest part between the fireproofing and the metal stack.

**Sec. 1035. (Chimneys.—Interior.—Framing Around.)**—No joists or girders shall rest and be supported on the walls of any chimney, and the framing around chimneys of all kinds shall be so constructed that in no case will any joists or timbers be placed nearer than two inches from the outside face of walls of flues, and in no case shall the distance from the inside of any flue to any joists or timbers be less than seven inches.

The foregoing shall apply only to chimneys which are enclosed by, or form part of, the interior of any building.

**Sec. 1036. (Chimneys.—External.—Location Of.)**—Chimneys may be built outside of the walls of existing buildings (but not in such manner as to encroach upon any street or alley), and shall be built as follows:

If at least one side of such chimney abuts entirely upon the wall of an existing building and the chimney is throughout its entire length securely and firmly anchored to the walls of such existing building, the wall of such chimney may be built of hollow tiles, in which case, however, it shall have a cast iron base, lined with fire brick, and extending to a height of at least ten feet above the street or alley grade.

**Sec. 1037. (Chimneys.—External.—Built of Iron or Steel.)**—Such external chimney may also be built of rolled steel or iron not less than one-fourth inch in thickness, and lined with insulating material, laid in fire clay, for at least thirty feet above street or alley grade, or it may be built throughout its entire height of cast iron, in which case the first ten feet above the street or alley grade shall be lined with insulating material; provided, however, that in chimneys not exceeding five hundred square inches in flue area, the upper twenty-five feet may be constructed of steel or iron not less than one-eighth inch thick.

**Sec. 1038. (Chimneys.—Isolated.)**—Isolated chimneys shall be so designed and constructed that the stress upon any part thereof, due from the weight of the stack itself and from wind pressure, shall never exceed the safe limits as provided in this ordinance.

**Sec. 1039. (Chimneys or Smokestacks.—Foundation Of.)**—The foundations of chimneys or smoke-stacks, whether inside or outside of buildings, or whether connected with the same or isolated, shall be designed and built in conformity with the provisions relating to foundations of buildings hereinbefore given.

**Sec. 1040. (Smoke Flues Passing Through Partitions.)**—Where smoke flues of diameter of six inches or less pass horizontally through a wood or a plastered stud partition, they shall be surrounded by a ventilated thimble of incombustible material.

Where a smoke flue of a greater diameter than six (6) inches passes through a wood or plastered stud partition, it shall be surrounded either by a body of brick, hollow tile, porous terra cotta or other incombustible substance, measuring at least eight (8) inches all around such smoke flue. Smoke flues of less diameter than twelve inches shall be kept at least twelve inches distant from any combustible partition, ceiling or floor, and such woodwork immediately over and for a distance of two feet on each side of such smoke flue shall be covered with sheet metal or with porous terra cotta, hollow tile or with plaster.

**Sec. 1041. (Smoke Flue.—Woodwork Around.)**—Smoke flues of greater diameter than twelve inches and less area than six square feet, shall be kept at least twenty inches away from any woodwork, and such woodwork shall be protected as before specified for the smaller smoke flues to a distance of four feet on each side of such smoke flues.

Wherever smoke flues of larger area than six square feet are used they shall be kept at least three feet distant from any woodwork, and such woodwork for a distance of at least six feet on either side of such smoke flues shall be protected as before specified for smaller flues.

**Sec. 1042. (Floors.—Protection Of.—Around Boilers, Furnaces, Etc.)**—Wherever steam boilers or furnaces or ovens, coffee roasters or other structures in which fires are maintained, are set inside of a building, or in a room with wooden floor or ceiling construction, the floor of the same shall be protected by a covering of brick or concrete not less than five inches thick set in mortar upon a continuous sheet metal bearing plate not less than three-sixteenths of an inch thick, all the joints of which are to be securely riveted, and the edges of which are to be turned up five inches all around. This foundation of sheet metal and brick and concrete shall extend under the whole of the fire box and ash pit of such steam boiler or furnace or other structure, and to a distance of not less than ten feet in front and at least four feet on the other three sides of same.

**Sec. 1043. (Ceiling.—Protection Of.—Around Boilers, Furnaces, Etc.)**—The space between the tops of such steam boiler or furnaces and any wood ceiling construction shall in no case be less than three feet, unless such boiler be a low pressure boiler, in which case such space shall be not less than eighteen inches, and the under side of such wood ceiling construction shall in all cases be protected either by three coats of plastering or metallic lath or wire netting, or at least two inches of porous terra cotta plastered on the under side, or by a covering of hollow tile with two air spaces at least one-half inch between the wood and the under surface thereof, which under surface shall also be covered with a heavy coat of plastering.

**Sec. 1044. (Boilers.—Location Of.—Permit For.)**—In all cases boilers shall be so placed as to give ample room between any ceiling, wall or partition to connect or operate any valves or pipes or other connections used on such steam boilers, and in buildings of 4,000 or more square feet in area, the size, number and location shall be marked on the plans before a permit is issued by the Building Department.

**Sec. 1045. (Cupolas of Foundries.)**—Cupolas of foundries shall extend at least ten feet above the highest point of any roof within a radius of forty feet of such cupola, and shall be covered on top with wire netting.

**Sec. 1046. (Pipes for Distribution of Hot Air.)**—Where pipes are used for the distribution of hot air from a hot air furnace, such pipes shall be made of metal and shall be double. The space between the two metal pipes shall be at least one-half inch. Such pipes are to be made with air tight joints and to be securely fastened to the partitions through which they pass.

**Sec. 1047. (Registers.—Openings in Floor For.)**—The openings in floors for hot air registers shall be surrounded with borders of incombustible material not less than two inches wide, and firmly and securely set in place. The register boxes shall be double, the distance between the two thicknesses of tin being at least one inch.

1038 to 1046—623 to 630, 1047—630

**Sec. 1048. (Pipes, Ducts and Registers.—Material For.)**—Where the air conveyed through pipes is heated in an ordinary hot-air furnace, or in any other apparatus by direct contact of the air with a fire box, the material used for these double ducts, pipes and register boxes shall be bright tin, and the joints shall be double-seamed, but not soldered. Where the air is heated by contact with hot water or steam pipes, any other sheet metal may be used for the pipes, and the use of double pipes is not obligatory.

**Sec. 1049. (Doors and Windows.—When Required to Be Closed.—Fire-Resisting Glass.)**—Wherever the distance between doors and windows in buildings of Classes I., II., IV., V., VII. and VIII., on opposite sides of alleys or courts shall be less than thirty feet, or wherever the distance between such doors and windows and any inside lot line of any lot upon which any such building is erected is less than fifteen feet, or wherever the distance between such doors and windows and the alley line (where the alley is less than thirty feet wide) is less than fifteen feet, such windows and the glazed portion of such doors shall be made of fire-resisting glass, set in frames of incombustible material.

Where the windows in buildings of Class I. on lot line courts are less than two feet from the lot line the sashes shall be stationary.

**Sec. 1050. (Class of Building Not to Be Changed Without Conforming to Provisions of This Ordinance.)**—If buildings, the uses of which bring them within any of the classes mentioned in this chapter are to be applied to the uses of any other class for which a better system of construction is called for by this chapter, the construction and equipment of such buildings shall first be made to conform to the requirements of this chapter as specified for their intended use. And it shall be unlawful to apply any such building to a new or different use than that to which its structure and equipment adapts it under this chapter, unless the requirements of this chapter for such new or different use shall first have been complied with, and a permit for such alteration of use shall have been first obtained from the Commissioner of Buildings.

**Sec. 1051. (Alteration of Existing Buildings.)**—Nothing in this chapter contained shall be considered as requiring alterations in the construction or equipment of buildings in existence at the time of the passage of this chapter, unless such buildings shall not have sufficient or adequate means of egress therefrom or ingress thereto by reason of insufficient or inadequate stairways, or stairways improperly located, or insufficient or inadequate elevators or elevator equipment, doors, fire escapes, windows or other means of egress or ingress.

Where it shall appear to the Commissioner of Buildings that any such building has inadequate or insufficient means of egress therefrom or ingress thereto, as aforesaid, he shall notify the owner, agent, or person in possession, charge or control of such building of such fact and direct him forthwith to make such alterations and changes in the construction or equipment of such building as are necessary to be made in order to promote the safety of the occupants of such building, and of persons using the same and of the public.

If, however, it is desired to enlarge, or in any manner materially modify the construction of any existing building, or to make change in its use or occupation which will transfer it from one class as recognized by this chapter to another class, then before such enlargement or structural change or modification of building is made, or before such change in its use or occupation may be made, the entire building shall be reconstructed or modified in such manner as to bring the same when enlarged or altered, or when occupied for its new and different purposes, in accordance with the provisions of this chapter.

**Sec. 1052. (Walls of Altered Buildings.—Increasing Thickness Of.)**—If the walls of a building are not of sufficient thickness to comply with the requirements of this chapter for an enlarged or modified building, then the thickness of the existing walls shall be increased by building alongside of them a new wall, which shall not, however, be less in any part thereof than twelve inches thick, and which shall be increased in thickness by four inches for at least every forty feet in the height of such wall. Such new wall shall be laid in Portland cement mortar and shall be anchored to the old wall (bonding with brick or masonry will not be considered as complying with this chapter); and if an increase in the height of the building is contemplated, the wall from the top of the old wall shall be built jointly upon the new and old walls. If solid masonry buttresses are introduced in connection with such thickening and strengthening of existing walls, the intervening wall may be reduced to eight inches in thickness, provided such buttresses are sufficient in num-

ber and in area to make the resultant structure of equal strength with the solid wall already specified. Provided, however, that steel or iron columns or beams may be used instead of such new wall, such columns or beams to be bolted or bonded to the existing wall in a manner satisfactory to and approved by the Commissioner of Buildings.

**Sec. 1053. (Walls.—Party.)**—The provisions of the preceding section shall also apply to all cases where existing party walls are to be joined to for the erection of new buildings. But in the case of party walls, which at the time of their erection were built in accordance with the terms of the city ordinances then in force, such walls, if sound and in good condition, may be used without increase of thickness for any building not higher than and of the same class as the building for which the original wall was built.

**Sec. 1054. (Walls.—Erection of.—Walls and Skeleton Framework Securely Braced.)**—In the erection of buildings of masonry construction, no wall shall be carried up at any time more than two stories above another wall of the same building. The walls and skeleton framework of all buildings shall be kept securely braced and otherwise protected against the effects of the weather during all building operations.

**Sec. 1055. (Tanks on Roofs.—Permits.—Fees.)**—It shall be unlawful for any person to construct, maintain, or to allow or permit to remain, in or upon the roof of any building in the city, any water tank of a larger capacity than four hundred gallons, unless such tank shall rest upon a good and sufficient foundation of solid brick or stone masonry, or upon iron girders set on steel plates, which rest upon a good and sufficient foundation of solid brick or stone masonry, or upon iron or steel construction; provided, however, that no water tank of a capacity exceeding four hundred gallons shall be constructed in or upon any building without first obtaining therefor a permit from the Commissioner of Buildings and paying therefor a fee of two dollars.

**Sec. 1056. (Stairs and Fire Escapes.—Obstruction Of.)**—It shall be unlawful under any circumstances to close up or obstruct during the occupation for business purposes of any building, the stairways or fire escapes or the approaches leading thereto, and no change in the position or construction of any such stairway or fire escape shall be made, unless the permission so to do of the Building Department first shall have been obtained.

## ARTICLE XVII.

### FRAME BUILDINGS.

**Sec. 1057. (Permits for Raising or Altering Buildings.—Requirements.)**—Permits to alter or raise frame buildings shall be given, provided they do not involve an enlargement or raising of such buildings beyond the limits of dimensions herein prescribed for frame buildings, and if the stresses upon the material thereof are kept within the safe limit of stresses herein prescribed in this chapter, and if, further, such frame building has not been damaged to any extent greater than fifty per cent of its original value by fire, wear and tear, the action of the elements or otherwise. Provided, however, where any frame building is raised for the purpose of erecting a basement story under the same, the walls inclosing such basement shall be of masonry.

**Sec. 1058. (Strength of Timber Constructions.—Outside of Fire Limits.)**—The provisions of this chapter as to the strength and stability of timber constructions shall also apply to the construction of frame buildings outside of the fire limits.

**Sec. 1059. (Frame Buildings Prohibited.—Exception.)**—Hereafter no frame building shall be erected within the fire limits of the city, except where express provision is made in this chapter therefor.

**Sec. 1060. (Frame Buildings Outside Fire Limits.)**—Outside of the fire limits it shall be lawful to erect frame buildings not exceeding forty feet in height from the sidewalk to the highest point of roof. If such frame buildings have a basement story of masonry, their height above the sidewalk may be made not to exceed forty-five feet.

**Sec. 1061. (Frame Buildings Inside Fire Limits.—Altered or Enlarged.)**—No existing frame buildings inside the fire limits shall be altered or enlarged beyond the limit of height and dimensions described in Sections 1060 and 1064 of this chapter.

**Sec. 1062. (Frame Buildings Inside the Fire Limits Changed Into Flat Buildings.—Fire Walls.)**—Whenever any frame building within the fire limits shall be remodeled, altered or changed for the purpose of using the same for flats or apart-

1053 to 1062—636 to 644

ments, or whenever such frame building shall be occupied for flat or apartment purposes, each suite of apartments in such building shall be separated from every other suite of apartments in such building by a wall of incombustible material, of such dimensions and thickness as required by this chapter.

**Sec. 1063. (Frame Buildings.—Raising.—Requirements.—Changing Gable or Hip Roofs to Flat Roofs.)**—Permission may be granted by the Commissioner of Buildings for the raising of existing frame buildings, whether within or without the fire limits, to the limits of height hereinbefore fixed for new frame buildings, and no more. The Commissioner of Buildings is also authorized to issue permits for changing gable or hip roofs of existing frame buildings to flat roofs, and for the raising of walls incident to such change. But if such hip or gable roof is changed to a flat roof and the walls raised in connection with such change, the total cubic contents included by the walls so raised and the roofs so altered shall not exceed the cubic contents originally included in such gable or hip roofs.

**Sec. 1064. (Frame Buildings.—Damaged.—Repairing.—Limitations.)**—It shall not be lawful to repair or reconstruct or remove any frame building which has been injured more than fifty per cent of its original cost by wear and tear, by the effects of the elements or by fire.

**Sec. 1065. (Lot Lines.—Requirements as to.—Number.—Dimensions.)**—Frame buildings shall not be built nearer than one foot to any line of the lot upon which they are built, street and alley lines excepted. It shall not be lawful to erect a frame building wider than forty feet nor deeper than seventy feet, unless such building be divided by a fire wall or fire walls, built of incombustible material and of a thickness to be approved by the Commissioner of Buildings, so that no more than two thousand eight hundred square feet of superficial area shall be contained in any section or part of such building, uninclosed by such fire wall. If more than one frame building is built in the direction of the depth of any one lot, such buildings shall not be built with a less distance than ten feet between them.

**Sec. 1066. (Chimneys in Frame Buildings.—Chimney Flues Through Partitions.)**—Chimneys in frame buildings shall be built of brick, or of hollow tile, with a double tile wall around the smoke duct; all joints, whether in tile or in brick chimneys, shall be well filled with mortar and neatly pointed on the outside. Brick chimneys shall have flue linings of fire clay on the inside where the inclosing walls are less than eight inches thick. The wood framing of frame buildings shall be trimmed around chimneys in such manner as not to come within two inches of the same.

Metal smoke pipes or tile flues of single thickness shall not extend through the floors or through the ceiling or roof of any building; and where such smoke pipes or tile flues pass through partitions the woodwork of such partitions shall be protected either by a course of brick built all around such smoke pipes or tile flues, or by a thimble made of bright tin, the two rings thereof being at least three inches apart, with proper ventilating holes provided in the outer covering of the same on both sides of the partitions.

**Sec. 1067. (Frame Buildings Carried to Uniform Height.)**—Frame buildings, the different parts of which are of different heights, may be carried up to a uniform height, provided the greatest height thereof does not exceed the limits of height prescribed in this chapter for frame buildings.

**Sec. 1068. (Basement or Story Placed Beneath Frame Buildings.)**—A frame building may be raised for the purpose of erecting a basement or story, or both, thereunder, but the principal floor of such frame building shall not be raised to a higher level than sixteen feet above the sidewalk grade of the sidewalk upon which such premises abut. The walls inclosing such basement or story shall be of masonry and not less than twelve inches thick, excepting that when a one-story frame building is raised and has a basement only built thereunder the masonry wall of such basement may be eight (8) inches thick above grade and twelve (12) inches thick below. The foundations of such walls shall be constructed as provided in this chapter. Provided, however, that no frame building shall be raised for the purpose of constructing a basement or story, or both, under the same to a greater height to the top of its roof than that elsewhere herein given as the maximum height above grade for frame buildings. The thicknesses of walls hereinabove required shall also apply to new frame buildings.

**Sec. 1069. (Sheds.—Frame.—Requirements.)**—Sheds not exceeding fourteen feet in height from the ground at the highest point thereof, and not exceeding three hundred feet in area, with an incombustible roof, may be constructed of wood within the fire limits. Such sheds shall not be located on the front part of any lot, nor shall they be used as a dwelling or as an addition to a dwelling house, or for any business purpose whatever, nor shall more than one shed be erected on any one building lot of twenty-five feet in width.

**Sec. 1070. (Sheds.—Open Shelter.—Height of Walls and Foundation.)**—Open shelter sheds may be constructed within the fire limits, provided they have incombustible roofing and the highest point of the roof thereof is not over fifteen feet above the ground, and provided that the roofing be supported on sufficient posts or piers. Such sheds shall have no combustible inclosing walls or wooden floors. No fence shall be used for the back or sides of such shed.

If it is desired or intended to inclose an open shelter shed, the inclosing walls shall be made of brick, stone, hollow tile or other incombustible material, and such walls shall have foundations extending to solid ground and at least four feet below the surface of the ground.

**Sec. 1071. (Sheds.—Coal Sheds Along Railroad Tracks.)**—Open shelter sheds to be used for the storage or handling of coal may be erected within the fire limits upon, along or adjacent to steam railroad tracks or along navigable waters; provided, such sheds shall have incombustible roofing and shall not exceed thirty-five feet in height from the ground to the highest point of the roofing. If it is desired or intended to inclose any such shed, inclosing walls thereof shall be covered with incombustible material. No such coal shed shall be built upon any lot or parcel of ground fronting upon any street within seventy-five feet of any building used exclusively for residence purposes, unless the consent of the owners of the majority of the frontage on both sides of such street between the two nearest intersecting cross streets shall first have been obtained by the person or corporation desiring to erect and maintain such coal shed.

**Sec. 1072. (Lumber or Junk Yards.—Lumber or Junk Not to Be Piled Near Residences Except by Consent.)**—No person or corporation shall establish, maintain, conduct or operate any lumber yard or place at, upon or in which new or second-hand lumber is kept for sale or is stored for seasoning or drying, or where old iron or junk is kept or stored on any premises fronting on any street in any block where two-thirds of the buildings on any street bounding any such block are used chiefly for residence purposes, unless the written consent of the owners of a majority of the frontage on both sides of all the streets bounding the block in which it is proposed to locate, establish, conduct or maintain such lumber yard or place be first obtained by the person or corporation desiring to establish, maintain or operate such lumber yard or place consenting to the issuance of a license for the establishment, keeping or maintenance of such lumber yard or place; and such written consents shall accompany the application for a license made by such person or corporation.

**Sec. 1073. (Lumber Not to Be Piled Near Planing Mills, Woodworking Establishments or Private Residences.)**—No person or corporation shall pile or store, or cause to be piled or stored, any lumber for the purpose of seasoning or drying the same or storing same or keeping such lumber for sale at any point within fifty feet of any planing mill, woodworking manufactory or private residence, unless same has been erected since the establishment of such yard.

**Sec. 1074. (Grand Stands.—Frame.—Within the Fire Limits.—Frontage Consents.)**—Wooden grand stands or tiers of seats commonly known and described as grand stands, may be erected within the fire limits where no part of any such structure shall be within sixty feet of any other building or structure, provided that the person or corporation desiring a permit for the construction of such a grand stand shall first obtain the consent in writing of the owners of a majority of the frontage on both sides of the street or streets on each side of the block or square in which it is desired to erect such grand stand.

**Sec. 1075. (Ice Houses)**—Amended March 19, 1906, to read as follows:

*Houses to be used exclusively for the storage of ice may be constructed within the fire limits of wood with incombustible roofing, the walls to be inclosed with an envelope of incombustible material; eight-inch brick or tile or approved cement concrete walls, with proper foundations of masonry, shall be used for such envelopes, and such houses shall be used for no other purposes than the storage of ice.*

*Provided, however, houses to be used exclusively for the storage of ice, may be erected and maintained contiguous with any lake, and six hundred feet from any other building, except buildings used in connection with the conduct of said business, outside of the fire limits, may be constructed of frame, with incombustible roofing, and may have a floor area of not to exceed 80,000 square feet.*

*Houses to be used exclusively for the storage of ice may be constructed of frame, with incombustible roofing, outside of the fire limits, of greater floor area than 80,000 square feet, provided that building is divided by a solid wall of masonry for each additional 80,000 square feet of floor area, or fractional part thereof, said wall to be approved by the Building Department, and to extend one foot beyond the enclosure of said building on each end.*

1070 to 1075—652 to 657

*Houses to be used exclusively for the storage of ice, built contiguous with railroad tracks, and not within one hundred feet of any other building, outside of the fire limits, may be constructed of frame, with incombustible roofing, with a floor area of not to exceed 5,000 square feet.*

*Houses to be used exclusively for the storage of ice, contiguous with railroad tracks and not within one hundred feet of any other building, outside the fire limits, may be constructed of frame, with incombustible roofing, of a larger area than 5,000 square feet, provided that building is divided by a solid wall of masonry for each additional 5,000 feet of floor area, or fractional part thereof, said wall to be approved by the Building Department, and to extend at least one foot beyond the enclosure of said building on each end.*

*All dividing walls must extend through and above the roof of any building in which they are built to a distance of three feet and must be covered with incombustible coping. No dividing wall shall be of less thickness than 12 inches at any point thereof.*

## ARTICLE XVIII.

### ELEVATORS AND HOISTWAYS.

**Sec. 1076. (Elevators, Passenger and Freight.—Permit for Construction.—Fee.)—**Before proceeding with the construction of any passenger or freight elevator, except such as are hereinafter specially exempted from the provisions of this chapter, there shall be obtained from the Commissioner of Buildings by the owner or agent of the building in which such elevator is to be constructed or by the contractor who is about to construct such elevator a permit for such construction, and it shall be unlawful for any such owner, agent or contractor to permit or allow the construction of any such elevator, or to proceed with, or in or about any of the work of construction of any such elevator until such permit shall first have been obtained. Such permit shall be issued by the Commissioner of Buildings after application shall have been made to him in writing therefor by any such owner, agent or contractor, specifying the number and kind of elevators which it is desired to construct and the location of the building or structure in which the same is or are to be placed, such application shall be accompanied with such plans and specifications as may be necessary to advise and inform said Commissioner of the plan of construction, type of elevator and location thereof. If such plans and specifications shall show that such elevator or elevators is or are to be constructed or erected in conformity with the provisions of this ordinance, the Commissioner shall approve the same and shall issue a permit to such applicant upon the payment by such applicant of a fee of two dollars for each elevator to be constructed and erected, and such fee shall be known as a construction fee, and shall not be held to cover the cost of any inspection which shall at any time thereafter be made of such elevator or elevators when constructed or any of the equipment thereof.

Any person, either as owner or agent of any building or structure in which any elevator or elevators is or are to be constructed, or any contractor engaged in erecting or constructing such elevator or elevators, who shall allow to be erected or constructed, or who shall attempt to erect or construct any elevator or elevators in any building or structure, without having previously obtained the permit herein required, and without having complied with the provisions of this section, shall be fined not less than fifty nor more than two hundred dollars for each offense.

**Sec. 1077. (Testing of Safety Devices.)—**Every passenger or freight elevator hereafter constructed (except such are hereinafter excepted from the provisions of this ordinance) in any building within the city shall be provided with some efficient device to secure the safe operation of such passenger or freight elevator in its running up or down, and such device shall be subjected to such practical test as may be determined by the Commissioner of Buildings to ascertain the efficiency of such safety device to properly perform the service for which it is intended; and it shall be the duty of the Commissioner of Buildings to cause to be made such test of each and every device upon any such elevator hereafter constructed, and no such elevator hereafter constructed shall be permitted to run until the inspection herein provided for has been made and a certificate issued by the Commissioner of Buildings or such inspector that the same has been inspected, and the certificate shall be posted in a conspicuous place in such elevator. Every passenger or freight elevator now in operation within the city shall be provided with some efficient device to procure the safe operation of such passenger or freight elevator in its running up and down, and such device shall be subjected to the same test as is herein provided for elevators to be hereafter constructed, and a certificate of such inspection issued as provided for elevators

to be hereafter constructed, and every such elevator now in operation within the city, or which may hereafter be constructed and operated in the city, shall be inspected under and by authority of the Commissioner of Buildings at least once every six months. Every owner or agent of any building who fails to comply with any provision of this section shall be fined not less than fifty dollars nor more than two hundred dollars for each offense, and every owner or agent of any building wherein any passenger or freight elevators are situated in the city who refuses to permit the inspection of any such elevator or who refuses to permit the making of the test in this section provided, shall be fined not less than twenty-five dollars nor more than two hundred dollars for each and every day on which such elevator runs or is operated on and after the date of the refusal to permit inspection of such elevator or the refusal to allow such test to be made.

**Sec. 1078. (Safety Devices.—Further.)**—Every passenger or freight elevator now running or operating within the city, or which may hereafter be constructed and run and operated, shall be provided with some efficient device for the purpose of preventing the cab or car of such elevator from falling, or the securing of the safety of the cab or car and its load, in case it does fall, and all such devices that are applied to such passenger or freight elevator for the purpose of preventing such cab or car from falling or for stopping it in case it does fall shall be subjected to a practical test, such test to be made under the supervision of the Commissioner of Buildings, to determine the efficiency of such device and to secure the safety of the cab or car and its contents. Every person, whether owner or agent of any building wherein any such passenger or freight elevator within the city is now run or operated, or which may hereafter be constructed or operated, who shall fail or neglect to provide such passenger or freight elevator with such device for the purpose of preventing the cab or car from falling, or the securing of the safety of the cab or car in case it does fall, shall be fined not less than twenty-five dollars nor more than two hundred dollars for each and every day on which such elevator is run or operated without being provided with such device.

**Sec. 1079. (Tests.—Owner Must Permit.)**—Any owner or agent of any building wherein any passenger or freight elevator is run or operated within the city who desires to have a test made by and under the authority of the Commissioner of Buildings as to whether such elevator is provided with sufficient and proper safety devices shall or may notify said Commissioner of Buildings in writing that such a test is desired; and the time when such test may be made, which shall not be less than two nor more than ten days after such notice is given to the Commissioner of Buildings; and it shall be the duty of every owner or agent of any such building wherein any such passenger or freight elevator is run or operated in the city, or which may hereafter be constructed and operated, to permit the making of the test of such devices upon demand being made by the Commissioner of Buildings or by a duly authorized inspector, and every owner or agent of any such building wherein any such passenger or freight elevator is run or operated, or which may be hereafter constructed and operated, who refuses to permit the test of such devices to be made upon demand of said Commissioner of Buildings or Elevator Inspector, within five days from and after such demand is made, shall be fined not less than twenty-five dollars nor more than two hundred dollars for each and every day on which such passenger or freight elevator is run or operated after such demand for and refusal of the making of such test.

**Sec. 1080. (Certificate to Be Furnished and Posted.)**—Whenever any such elevator shall have been inspected and the tests herein required shall have been made of all safety devices with which such elevator is required to be equipped, if the result of such inspection and tests shall show such elevator to be in good condition, satisfactory to the Commissioner of Buildings or the Inspector of Elevators, and that such safety devices have been provided, in accordance with the requirements of this chapter, and are in good working condition and in good repair, it shall be the duty of the Commissioner of Buildings or Inspector of Elevators to issue or cause to be issued, upon the payment of the inspection fee required by the provisions of this chapter, a certificate setting forth the result of such inspection and tests, and whether such elevator and its equipment is in safe condition and in good working order. Such certificates shall be furnished to the owner or agent of the building wherein such elevator is operated, and shall be posted by such owner or agent in a conspicuous place in such elevator.

If the result of such inspection or tests shall show such elevator not to be in safe condition or not to be in a condition of good repair, or shall show that such devices, or any of them, have not been furnished, or, if furnished, are not in good working order or in a good condition of repair, such certificate shall not be issued

until such elevator and its equipment or such safety device or devices shall have been put in good working order and in a good condition of repair, satisfactory to the Commissioner of Buildings or the Inspector of Elevators.

In any event, however, the inspection fees herein required shall be paid either at the time application is made for inspection or upon the completion of such inspection and tests.

**Sec. 1081. (Tests to Be Made Semi-annually.)**—It shall be the duty of the Commissioner of Buildings to cause the tests to be made as provided for in Sections 1077, 1078 and 1079 of this ordinance of each passenger and freight elevator in the city at least once in every six months from and after the issuance of the first certificate.

**Sec. 1082. (Inspectors.—Duties of.)**—Whenever any inspector of any passenger or freight elevator finds any of the running parts or automatic devices, or other equipment out of order or in an unsafe condition he shall immediately report the same to the Commissioner of Buildings, together with a statement of all the facts relating to the condition of such elevator or elevators.

**Sec. 1083. (Power to Shut Down Elevators.)**—It shall be the duty of the Commissioner of Buildings, upon receiving a report from any inspector of the unsafe condition of any elevator, to order and cause such elevator to be stopped from use until the same shall have been placed in a safe condition, and any owner or agent of any building wherein any such passenger or freight elevator is run or operated within the city who permits or allows any such elevator to run after the receipt of a notice, in writing, from the Commissioner of Buildings that any such elevator is out of order, or is in an unsafe condition, shall be fined not less than twenty-five dollars nor more than two hundred dollars for each and every day on which such elevator is run or operated without being put in a safe condition or placed in good order.

**Sec. 1084. (Device.—Efficient.—To Be Approved.)**—Any device which shall prove efficient for the purposes hereinbefore described in this chapter shall be approved by the Commissioner of Buildings, if, after a test by said Commissioner or any of his Elevator Inspectors, it is found that such device or devices satisfactorily performs the work it is intended should be performed by such device or devices in and by the provisions of this chapter.

**Sec. 1085. (Inspections to Be Made at the Same Time.—One Fee.)**—All certificates for and inspections of hoistways and elevators provided for in this article shall be made at the same time and the fee required to be paid by Section 1087 of this ordinance shall include the cost of all such inspections and issuance of such certificates.

**Sec. 1086. (Elevators Not Required to Be Equipped with Safety Devices.)**—The provisions of this chapter requiring the equipment of elevators with safety devices shall not apply to any elevator or elevators in any private residence not more than three stories in height, nor to any hand hoists, elevator or hoist used solely for hoisting materials or tools in any building in course of construction.

For the purposes of this section, flat or apartment buildings shall not be held to be private residences, and any elevator or elevators operated in such flat or apartment buildings shall be equipped with safety devices in accordance with the provisions of this chapter.

**Sec. 1087. (Inspections.—Fees.)**—The owners, agents or occupants of any building in which an elevator is used shall pay to the City Collector, before a certificate of inspection is issued, a fee of two dollars for each inspection of each elevator made in pursuance of the provisions of this ordinance.

**Sec. 1088. (Certificates of Inspection.—Construction.—Details of.)**—When an inspector finds a hoistway, door, shaft and elevator and its equipment, including safety devices, in a sound and safe condition, he shall make and deliver to the owner, or to his agent, a certificate signed by the Commissioner, which shall contain the date of inspection, the condition of the elevator at that date, the weight it may safely carry, and a statement that the shaft, doors and all equipments, including safety devices, are constructed in a safe and proper manner and are constructed in accordance with the provisions of this chapter, which certificate shall be by the owner of the elevator framed and put in some conspicuous place in such elevator for examination by the public; provided, that the words "safe condition" in this section shall mean that it is safe for any load up to the amount of weight named in such certificate.

**Sec. 1089. (Hatch.—Doors.—Freight Elevators.)**—It shall be lawful for elevators used exclusively as freight elevators to be without inclosing walls, but in all such

cases there shall be at every floor through which such freight elevators pass automatic hatch closers or automatic doors, made in such manner that they will fully close each well hole when the temperature in such well hole exceeds one hundred and forty degrees Fahrenheit; and it shall be the duty of the owner, agent or person in possession, charge or control of the building in which such elevator or elevators is or are maintained to keep such hatch closers or doors at all times in good working order, and any such owner, agent or person failing to do so shall be fined not less than twenty-five dollars nor more than two hundred dollars for each offense.

Before any doors shall be considered as complying with the provisions of this section they shall be examined by the Commissioner of Buildings and the Fire Marshal, and if it be found by such officials that such doors will automatically close when the temperature at or near the same exceeds one hundred and forty degrees Fahrenheit, and that also the conditions of construction and operation of such doors or hatch closers are such that there is no reasonable probability of their getting out of order and failing to operate when required, and if there is nothing in their construction or operation that is likely to cause accidents to or interference with the elevator service in the hatch holes which they are intended to close, then, and in such case only, shall the use of such hatch closers or doors be permitted.

But such automatic hatch closers or doors shall only be permitted in cases where the building in which such freight elevator is in use shall be equipped with stairways, or stairways and passenger elevators, sufficient to afford ample means of escape from such building in case of fire for all persons employed or for all persons in such building, and in buildings not so equipped such freight elevators shall be inclosed in fireproof walls, as hereinafter required.

Provided, that all freight elevators herein specified shall be either inclosed in fireproof walls, as hereinafter required, or equipped with automatic hatch closers or doors, as herein specified; and provided, further, that this section shall not apply to elevators in fireproof buildings.

**Sec. 1090. (Passenger and Freight Elevators.—Inclosure of.)**—In all non-fireproof buildings all passenger elevators and all freight elevators, except such as are expressly excepted by this chapter, shall be inclosed in a wall of brick, tile or such other incombustible material as may, from time to time, be approved by the Commissioner of Buildings as proper and suitable for the purpose; such wall to extend from the foundation to the roof of such building, and when built of brick or tile to be entirely self-sustaining; provided, that where such elevator shafts are placed within walls or partitions of fireproof material surrounding such shafts in common with stairways, or in common with stairways and corridors, additional inclosures about such shafts alone shall not be required. Provided, further, however, that the provisions of this section shall not apply to any non-fireproof building which is equipped throughout on every floor and in every room thereof and in all stairways, platforms, elevator shafts, elevator hoistways and well holes with an automatic sprinkler system approved by the Fire Marshal.

**Sec. 1091. (Doors.—On Elevators.)**—In all elevator shafts which are herein required to be inclosed with fireproof walls, the openings through which ingress and egress to and from such elevators is had, shall be equipped with fireproof doors, of iron or other incombustible material, to be approved by the Building Commissioner, which shall be made to open from the inside, except that they shall also be made to open from the outside by means of a key or other device satisfactory to the said Commissioner.

**Sec. 1092. (Skylights.—Over Elevators.—Windows.)**—The roof of each such passenger elevator, shaft or inclosure shall be formed by a skylight, and passenger elevators shall have a ventilator of at least one-twentieth of the area of the shaft, which shall have an operating device which shall be operative from every floor. Skylights may be omitted in shafts wherein there are windows opening on streets, alleys or courts or other vacant spaces, which will permit sufficient light and air, but such windows shall be glazed with fire-resisting glass.

The foregoing provisions relating to elevators and hoistways shall apply to buildings now existing or hereafter constructed.

**Sec. 1093. (Safety of Employes.—Provisions For.)**—In every factory, workshop, or other place or structure where machinery is employed, the belting, shafting, gearing, elevators and every other portion of machinery, when so located as to endanger the lives and limbs of those employed therein while in the discharge of their duties, shall be, as far as possible, so covered or guarded as to make them reasonably safe and to prevent injury to such employes.

## ARTICLE XIX.

### FIRE ESCAPES AND STANDPIPES.

Sec. 1094. (Buildings Required to Have Fire Escapes and Standpipes.—Inspection.—Fee.)—All buildings of four or more stories in height, in the city, except buildings used exclusively for private residences having two flights of stairs leading from the ground floor to the top floor of the building, shall be provided and equipped with one or more metallic standpipes and ladders combined, or stair fire escapes, as described in Section 1102 of this chapter, with wrought-iron or steel balconies, with suitable railings at each floor, and firmly secured to the outer walls, and in such locations and numbers as shall be satisfactory to the Commissioner of Buildings, the Fire Marshal and the fire-escape inspector.

All such fire escapes shall be put up and completed to conform to the buildings for which they are respectively intended, and shall be inspected after completion, and if found in a perfectly safe and satisfactory condition, a certificate shall be issued by the Commissioner of Buildings to that effect, to the owner, agent or occupant of any such building, upon payment to the city collector of a fee of one dollar.

Sec. 1095. (Specifications for Ladder Fire Escapes.—Anchors.)—All single and double fire escapes, with ladders, hereafter erected, shall be in strict accordance with the following specifications:

There shall be no less than three one-inch square wrought-iron anchors to every six-foot balcony, and six for a twelve-foot balcony. Such anchors shall pass through the wall of building and bolt on the inside with a three-fourths by two inch nut and three and one-half inch iron washer back of nut, where the wall is not over twenty inches thick; but where wall is over twenty inches thick, anchors shall be inserted at least eight inches into the wall on an angle of thirty-five degrees.

The brace of anchors shall at least be twenty inches spread, and pass into the wall four inches at bottom. No other form of anchors shall be allowed without a special permit from the Commissioner of Buildings.

Sec. 1096. (Balconies.)—All balconies hereafter erected shall be either steel or wrought iron, capable of sustaining a weight of five hundred pounds to the square foot. The balcony frame shall be made of not less than one and one-half by three inch angle iron, securely riveted together, with crossbars every two feet, such bars to be punched one-half inch square every two inches center, and one-half inch square iron forced through the same, leaving a manhole of not less than twenty-four by twenty-four inches. The crossbars shall be securely riveted to the angle iron frame. The crossbars for a balcony twenty-eight inches wide shall be one and one-half by three-eighths inch iron. Balcony frames over twenty-eight inches wide shall be made of not less than two by three-eighths inch iron to conform with the increased dimensions of iron in crossbars; for thirty-inch balcony, two by three-eighths inch; for thirty-six inch balcony or over, two and one-half by three-eighths inch. All balconies over this width shall have a two-inch "T" iron through the center of balcony for the bars to rest upon. Such balconies shall have a substantial cast or wrought iron post every three feet, bolted to the balcony. No balcony shall have less than two guard rails, which shall be of wrought iron, or new pipe not less than three-fourths inch in diameter, and the ends shall be anchored in the wall of building not less than ten inches on an angle of thirty-five degrees.

Sec. 1097. (Ladders.)—The ladder, where used in combination with the standpipe, shall be bolted to such standpipe with short tapped bolts every four feet and bolted to the balconies. Rungs of ladder to be one-half inch square iron, with the corners upward, so as to give a safe footing. Every other run shall be riveted and shall be fourteen-inch centers. Where ladder is put up without a standpipe, the side guards shall be two by three-eighths inch flat iron or one and one-fourth inch pipe. All ladders shall be seventeen inches or more between pipes. No second-hand pipe shall be used.

Sec. 1098. (Standpipes Outside Buildings.)—The standpipe shall be of the best three-inch wrought iron, seven and one-half pounds to the foot, and a two and one-half inch brass hose valve, of the city standard thread, shall be attached to the standpipe at every outlet at each floor and on the roof.

Sec. 1099. (Standpipes Inside Buildings.—Hotels and Lodging Houses Over Three Stories to Have.—Location and Maintenance of, Subject to Approval by Fire Marshal.—Penalty.)—As amended by ordinance March 19, 1906, to read as follows:

(1) In every building over one hundred (100) feet in height not provided with a three (3) inch or larger inside standpipe; in all buildings hereafter constructed of a greater height than seventy-five (75) feet (except buildings used for theater purposes, as herein

1694 to 1099—675 to 680

elsewhere provided for); in all buildings used for hospital purposes of a greater height than three (3) stories, with accommodations for at least twenty (20) patients; and in all buildings of a greater height than five (5) stories now or hereafter used for hotel or public lodging house purposes there shall be constructed one (1) or more four (4) inch standpipes, which shall extend from basement to roof, and which shall be connected at street or alley side of building with two-way Siamese connection for use of fire department, and which shall be provided with one hose connection with fire department thread, on the roof of said building, on each floor and in the basement thereof, with sufficient hose attached to reach any point thereof. The pattern, quality, installation and maintenance of such standpipe, hose and couplings, shall be subject to the approval of the Fire Marshal.

(2) In any of the buildings herein referred to where approved sprinkler systems are installed and properly maintained, it shall not be necessary to install additional inside standpipe as above provided for.

(3) On each floor and in the basement of every building used for hotel, public lodging, hospital or school purposes, three or more stories in height, on each floor of all apartment buildings over three (3) stories in height, the floors of which are divided into two or more apartments; on each floor of all office buildings, four (4) or more stories in height, the floors of which exceed two thousand (2,000) square feet in area; on each floor of all mercantile buildings, three (3) or more stories in height, having a floor area of two thousand (2,000) or more square feet which is not equipped with approved wet sprinkler system, standpipe and hose, there shall be provided two (2) or more portable hand-pumps, or chemical extinguishers, one or more fire axes, and one or more pike poles, all of which shall be installed and maintained subject to the approval and supervision of the Fire Marshal.

(4) The interior of all grain elevators and malt houses of a height of fifty (50) or more feet, which are not entirely fireproof, and which have a capacity of two hundred and fifty thousand (250,000) bushels or over, and the interior of all cold storage houses of a height of four (4) or more stories, which are not entirely fireproof and which have a ground floor area of ten thousand (10,000) or more square feet, shall be equipped with either a dry or wet sprinkler system, to each of which systems there shall be a feeder or riser pipe or pipes not less than four (4) inches in diameter, leading from one or more Siamese steamer connections; all of which shall be installed and maintained subject to the approval of the Fire Marshal.

(5) Grain elevators which are equipped with Journal Fire Alarm Systems of the most approved pattern and which are left at all times in the most perfect working order, or grain elevators, malt houses and cold storage houses, which are not equipped with standpipes of approved pattern and hose, with not less than two (2) inch connections, which have been installed in accordance with city ordinances and approved by the Fire Department, each floor of which is approved by said department as being at all times easily accessible to firemen, where fire extinguishers, water barrels and pails are distributed at intervals on all floors, on advice and instruction of the Chicago Underwriters' Association; where the necessary pump pressure is maintained; where some approved electric watch service and fire alarm system is maintained and watchmen are employed during nights, Sundays and holidays, pulling such stations not less frequently than once per hour, and which have outside Siamese connections and standpipes not less than two and one-half (2 1-2) inches, shall be exempt from the provisions of this ordinance.

**Sec. 1100. (Siamese.)**—There shall be a two-way automatic siamese at the bottom of each standpipe, so that two steam fire engines may be attached to it without interfering with each other. Such siamese shall be within easy reaching distance from the sidewalk and be securely anchored to the wall of the building.

**Sec. 1101. (Anchors for Top of Standpipe.—Painting.)**—All the anchors for the top of standpipe and ladders shall pass through the wall and bolt on the inside of same.

All work shall be painted with two coats of the best mineral paint, and all holes shall be filled up with the best cement.

**Sec. 1102. (Stairway Fire Escapes.—Erection of.—Location.—Component Parts.)**—The Commissioner of Buildings or fire escape inspector shall determine upon the location of all stair fire escapes before erection of same is commenced.

A permit shall be obtained from the Department of Buildings before work is commenced, which permit will be issued on payment to the city collector of a fee of two (\$2) dollars.

No permit for a stairway fire escape projecting three feet or more from the face of the wall shall be granted unless a detailed plan for the fire escape, approved by a licensed architect or practicing structural engineer, is submitted to the Commissioner of Buildings, and a copy of such plans shall be left on file with said commissioner.

**(Anchors.)**—All anchors for stairway fire escapes shall, wherever possible, pass through the wall of building and be secured on inside of same. Where it is impossible to anchor through walls, anchors shall be put in wall not less than fifteen inches at an angle of thirty-five degrees. On buildings of steel construction, where walls are less than twenty inches in thickness, there shall be steel channels at least four inches wide set on inside of building from column to column and bolted or riveted to columns, and anchors shall be bolted on inside of channels.

Anchors for a platform four feet two inches or less in width shall be made of one-inch square iron; over four feet two inches and not over six feet, shall be one and one-fourth inch square iron, with brace; over six feet, shall be one and one-half inch square iron, with brace. All anchors shall be turned up not less than six inches at the outside of platform to bolt post to.

**(Braces.)**—Braces shall be the same thickness as the anchors. Spread of braces shall be the width of platform. Where the platforms are over five feet in width, anchors shall have double braces, one to the outside and one to the center of platform.

**(Platforms.)**—Platforms shall be not less than fifty inches wide at ends; passageways shall be not less than twenty-four inches between building and railings. Platforms shall be not less than twelve feet in length. The frames and crossbars shall be made as specified by Section 1096 of this chapter. Platforms shall have clips at each end bolted to anchors. No door or window or shutter shall open so as to obstruct in any way the free passage on or along a platform or a staircase or ladder fire escape.

**(Stairs.)**—All fire escape stairs for apartment buildings, hotels, boarding houses, factories and office buildings, where there are less than one hundred people, shall be not less than two feet wide between railings and stringers. Where there are more than one hundred people, stairs shall be three feet wide. All stairs for halls, churches, theaters, hospitals, schools, department stores and buildings where large numbers of people congregate shall be not less than three feet wide in the clear, and all passageways shall be not less than three feet wide in the clear; stringers shall be made of two bars three by five-sixteenths inch, about one inch apart, or four and one-half by three-eighths inch flat iron. Where over twelve feet in length, they shall have anchor and brace in center. The treads shall be made of one-half inch square steel or iron, corner upward not to exceed one and five-eighths inches center, riveted at ends to two by five-sixteenths inch flat iron or steel. There shall be not less than four bars to a tread, where treads are less than twenty-seven inches in length; where treads are over twenty-seven inches in length, there shall be not less than six bars to a tread; then, there shall be a truss supporting treads made of bar iron two inches by three-eighths of an inch, riveted to bars of treads in center, supported by two seven-sixteenth inch rods bolted at each end of treads. All stairs shall have an incline of about forty-five degrees; rise of treads shall be not less than seven inches and not more than ten inches.

**(Railings.)**—All stairs shall have three bar railings made of one-inch bar iron for top rail and three-quarter inch bar iron for lower rail, and when such stairs are more than three inches from wall of building, then there shall be one or more hand rails on the wall side of such stairs.

**(Posts.)**—All posts used for stair fire escapes shall be made of one and one-half inch angle or channel iron not less than three feet six inches high, and shall have braces on outside turned upward and fastened to frame of balcony or stairs and not less than half way up the post; all stair fire escapes shall extend to the ground, either by counterbalance or drop stairs. Cable for counterbalance stairs shall be not less than three-quarters inch in size, and shall be well oiled or greased when hung up, and oiled or greased at least once a year. All pulleys and cables holding counterbalance shall be covered at bracket, so as to protect it from snow or ice.

**(Painting.)**—All stair fire escapes shall be painted with two coats of paint, one at the shop and one after completion at the building.

Where it is impossible to erect stair fire escapes according to these specifications, then plans shall be submitted to the Commissioner of Buildings or fire escape inspector for approval.

All such fire escapes shall, on completion, be inspected by the fire escape inspector, and if found safe and satisfactory, a certificate will be issued upon payment of one (\$1) dollar to the city collector.

**Sec. 1103. (Fire Escapes in General.)**—No fire escape of any kind shall be constructed except upon a permit therefor issued by the Commissioner of Buildings upon the payment by the applicant therefor to the city collector of a permit fee of two dollars.

Every building in the city required by law to be equipped with metallic stand-pipes and wrought iron or steel balconies, or other fire escape devices, shall have

displayed in conspicuous places, on each floor of such building, notices sufficient in number and in plainly legible type at least six inches in height, indicating and showing the location of such metallic ladders, balconies and fire escapes and the easiest way to reach them. If such notices be not displayed within thirty days after such equipment and kept continuously displayed, said commissioner is authorized to take such action as may be necessary to have such building closed.

Sec. 1104. (**Penalty.**)—Any owner, agent or person in possession, charge or control of any such building, who violates, disobeys, omits or neglects to comply with the terms of the foregoing section, shall be fined not less than five dollars nor more than fifty dollars for each offense, and every such owner, agent or person shall be deemed guilty of a separate offense for every day such violation, disobedience, omission or neglect shall continue, and shall be subject to the penalty imposed hereby for each and every such separate offense.

Where stair fire escapes pass windows or doors, the windows or doors shall be of fire-resisting glass and have metal frames and sash, or such fire escapes shall be hooded with metal for at least two feet each side of such opening.

## ARTICLE XX.

### FIRE LIMITS.

Sec. 1105. (**Fire Limits of City.**)—The fire limits of the City of Chicago shall be and are hereby defined as follows: All that part of the City of Chicago bounded by the following limits: Commencing at the intersection of the shore of Lake Michigan and a line one hundred and fifty feet north of the center line of Belmont Avenue, thence west on said first mentioned line to the center line of North Halsted street, thence south along said center line of North Halsted street to the center line of Fullerton avenue, thence west along said center line of Fullerton avenue to the center of the north branch of the Chicago river, thence northwesterly along the center of said north branch of the Chicago river to the center line of Belmont avenue, thence west along said center line of Belmont avenue to the center line of Kedzie avenue, thence south along said center line of Kedzie avenue to the center line of West North avenue, thence west along said center line of West North avenue to the center line of North Fortieth avenue, thence south along said center line of North Fortieth avenue to the center line of the first alley north of Park avenue, thence west along the center line of said alley to the center line of South Forty-sixth avenue, thence south along said center line of South Forty-sixth avenue to the center line of West Madison street, thence west along the center line of West Madison street to the center line of South Forty-eighth avenue, thence north along said center line of South Forty-eighth avenue to the center line of Kinzie street, thence west along said center line of Kinzie street to the center line of South Fifty-second avenue, thence south along said center line of South Fifty-second avenue to the center line of West Madison street, thence east along said center line of West Madison street to the center line of South Fiftieth avenue, thence south along said center line of South Fiftieth avenue to the north line of the present right of way of the Chicago & Great Western Railroad Company, thence east along the said north line of said right of way to the center line of South Forty-eighth avenue, thence south along said center line of South Forty-eighth avenue to the center line of West Twelfth street, thence east along said center line of West Twelfth street to the center line of South Forty-sixth avenue, thence south along said center line of South Forty-sixth avenue to the center line of West Twenty-second street, thence east along said center line of West Twenty-second street to the center line of South Fortieth avenue, thence south along said center line of South Fortieth avenue to the center line of the Illinois and Michigan canal, thence northeasterly along the center line of said canal to the center line of South Western avenue, thence south along said center line of South Western avenue to the center line of West Thirty-ninth street, thence east along said center line of West Thirty-ninth street to the center line of State street, thence south along said center line of State street to the north line of West Forty-seventh street, thence west along said north line of West Forty-seventh street to a line seventy-five feet west of the west line of South Halsted street, thence south along said line seventy-five feet west of the west line of South Halsted street to a line seventy-five feet north of the north line of West Sixty-third street, thence west along said line seventy-five feet north of the north line of West Sixty-third street to the center line of South Ashland avenue, thence south along the center line of South Ashland avenue to the center line of West Sixty-third street, thence east along said center line of West Sixty-third street to the center line of State street, thence south along said center line of State street to the center line of East

Seventy-fifth street, thence east along said center line of East Seventy-fifth street to the shore of Lake Michigan, thence northerly and northwesterly along the shore of Lake Michigan to the place of beginning.

Also commencing at a point in the center of Manistee avenue where it intersects the right of way of the main line of the Lake Shore and Michigan Southern railroad; thence northeasterly and north along the center line of Manistee avenue to the center line of Eighty-ninth street, thence east along the center line of Eighty-ninth street to the center line of Mackinaw avenue, thence south along the center line of Mackinaw avenue to the center line of Harbor avenue, thence southwesterly along the center line of Harbor avenue and Harbor avenue extended to the northeasterly line of said Lake Shore and Michigan Southern railroad, thence northwesterly along the northeasterly line of said right of way to the place of beginning.

Sec. 1106. (**Fire Limits.—Provisional.**)—Provided, however, that any person desiring to erect a frame or wooden building, to be used for residence or mercantile purposes within that portion of the territory bounded on the east, between Sixty-seventh and Seventy-fifth streets, by Lake Michigan, on the south by the center line of Seventy-fifth street, on the west by the center line of State street to the intersection of Sixty-third street, thence east along the center line of Sixty-third street to the intersection of Cottage Grove avenue, thence south along the center line of Cottage Grove avenue to the intersection of Sixty-seventh street, thence east along the center line of Sixty-seventh street to Lake Michigan, shall have a right to do so, upon presenting a petition to the Commissioner of Buildings, together with a plat, plans and specifications showing the place where such building is to be erected. Such petition shall be verified by the affidavit of the applicant and shall contain the written consent of the owners of a majority of the frontage upon each side of the streets or alleys in the block or square in which the building is to be erected.

No frame or wooden residence or mercantile building shall be erected within the said provisional fire limits exceeding forty feet in height unless the basement story shall be constructed of brick or stone, in which case the height shall not exceed forty-five feet above the sidewalk.

Sec. 1107. (**Fire Limits.—Exception From.**)—There shall be excepted from the fire limits as hereinbefore defined, the territory bounded as follows:

Commencing at the intersection of a line seventy-five feet west of the west line of State street and a line seventy-five feet south of the south line of Forty-seventh street, thence west along said line seventy-five feet south of the south line of Forty-seventh street to a line seventy-five feet east of the east line of Wentworth avenue, thence south along said line seventy-five feet east of the east line of Wentworth avenue to a line seventy-five feet north of the north line of Sixty-third street to a line seventy-five feet west of the west line of State street, thence north along said line seventy-five feet west of the west line of State street to the place of beginning.

Also that territory within the lines beginning at the intersection of a line seventy-five feet west of the west line of Wentworth avenue and a line seventy-five feet south of the south line of Forty-seventh street, thence west along said line seventy-five feet south of the south line of Forty-seventh street to a line seventy-five feet east of the east line of South Halsted street, thence south along said line seventy-five feet east of the east line of South Halsted street to a line seventy-five feet north of the north line of Sixty-third street, thence east along said line seventy-five feet north of the north line of Sixty-third street to the center line of Princeton avenue, thence north along said center line of Princeton avenue to the center line of Sixty-first street to a line seventy-five feet west of the west line of Wentworth avenue, thence north along said line seventy-five feet west of the west line of Wentworth avenue to the place of beginning.

## ARTICLE XXI.

### FRONTAGE CONSENTS.

Sec. 1108. (**Definition of Word "Block," as Used in This Chapter.**)—Whenever in this chapter a provision is made that frontage consents shall be obtained for the erection, construction, alteration, enlargement or maintenance of any building or structure in any block, the word "block," so used, shall not be held to mean a square, but shall be held to embrace only that part of a street bounding the square which lies between the two nearest intersecting streets, one on either side of the point at which such building or structure is to be erected, constructed, altered, enlarged or maintained, unless it shall be otherwise specifically provided.

**Sec. 1109. (Hospitals.—Permits.—Special Consents.—Height Of.)**—It shall be unlawful for any person or corporation to build, construct, maintain, conduct or manage in any block, if two-thirds of the buildings fronting upon both sides of the streets bounding such block or square are devoted exclusively to residence purposes, any hospital for the care, treatment or nursing of three or more insane persons; or any hospital for the care, treatment or nursing of three or more inebriates, or persons suffering from the effects of the excessive use of alcoholic liquors; or any hospital for the care, treatment or nursing of three or more epileptics; or any hospital for the care, treatment or nursing of three or more persons addicted to, or suffering from, the excessive use of morphine, cocaine or other similar drugs or narcotics; or any hospital for the care, treatment or nursing of any person or persons affected with any infectious or contagious disease, unless the owners of a majority of the frontage in such block and in addition thereto the owners of a majority of the frontage on the opposite sides of the streets bounding such block consent in writing to the building, constructing or maintaining, managing or conducting of any such hospital in such block. Such written consents of the majorities of such property owners shall be filed with the Commissioner of Buildings, and an exact copy of same shall be filed with the Commissioner of Health before a permit shall be granted for the building or constructing or a license issued for the maintaining, conducting or managing of any such hospital. Provided, that any such building that may be used for such purposes as set forth in this section and which is over two stories in height shall be of fireproof construction throughout, and no hospital shall be built to exceed six stories in height.

**Sec. 1110. (Hospitals Near Schoolhouses.—Location Of.)**—No hospital of any kind or description hereafter erected or established shall be erected or established within four hundred feet of any property used for school purposes.

**Sec. 1111. (Stables.—Gas Reservoirs.—Blacksmith Shops.—Foundries.—Packing Houses.—Rendering Plants.—Soap Factories.—Tanneries.—Breweries.—Distilleries.—Grain Elevators.—Junk Shops.—Laundries.—Special Consents Necessary.)**—It shall not be lawful for any person or corporation to locate, build, construct or maintain, on any street or alley in the city, in any block in which two-thirds of the buildings on both sides of the street are used exclusively for residence purposes, any building for a boarding, livery or sale stable, gas reservoir, blacksmith shop, foundry, packing house, rendering plant, soap factory, tannery, brewery or distillery, grain elevator, junk shop, or laundry to be run by machinery, without the written consent of a majority of the property owners, according to frontage, on both sides of such street or alley.

Such written consent shall be obtained and filed with the Commissioner of Buildings before a permit is issued for the construction of any such building. Provided, that in determining whether two-thirds of the buildings on both sides of the street are used exclusively for residence purposes any building fronting upon another street and located upon a corner lot shall not be considered.

**Sec. 1112. (Reformatories.—Sheltering Institutions.)**—It shall be unlawful for any person or corporation to build, construct, maintain, conduct or manage any reformatory, rescue or sheltering institution in any block or square in which two-thirds of the buildings on both sides of the street or streets on which the proposed reformatory, rescue or sheltering institution may front are used exclusively for residence purposes, without the written consent of a majority of the property owners, according to frontage, on both sides of the streets bounding such block.

Such written consent shall be obtained and filed with the Commissioner of Buildings before a permit is issued for the construction or keeping of such building.

Provided, that in determining whether two-thirds of the buildings on both sides of the street are used exclusively for residence purposes, any building fronting upon another street and located upon a corner lot shall not be considered.

**Sec. 1113. (Permits for Moving Frame Buildings.—Requirements.—Written Consents Must Be Obtained.—Affidavits Made.)**—Permits to move frame buildings shall be granted, if any such frame building has not been damaged to an extent greater than fifty per cent of its original cost, by fire, wear and tear, the action of the elements or otherwise. Any person desiring to remove a frame building shall first obtain the written consent to such removal from persons owning a majority of the frontage of the lots in the same block or square in which it is proposed to locate such removed building, and also the consent of the persons owning a majority of the frontage of the lots opposite and nearest to the proposed location and within one hundred and fifty feet of the same.

This section shall not apply to the case of any person removing a building upon his own premises and not going upon the premises of any other person, or upon any street, alley or other public place, in making such removal.

Provided, however, that no permit shall be issued for the removal of any frame

building from any point outside the fire limits to any point within the fire limits, when such building is of such a character that it would not be lawful to build it within the fire limits.

## ARTICLE XXII.

### USE AND OBSTRUCTION OF STREETS FOR BUILDING PURPOSES.

Sec. 1114. (**Sidewalk and Street.—Occupation Of.—Limitations.**)—The extent of occupation of sidewalk and street to be covered by the terms of a permit for street obstruction or building shall be as follows:

Such permit shall not authorize the occupation of any sidewalk or street or part thereof other than that immediately in front of the lot or lots upon which any building is in process of erection and in relation to which such permit is issued.

During the progress of building operations a sidewalk not less than four (4) feet in width shall be at all times kept open and unobstructed for the purpose of passage in front of such lot or lots. Such sidewalk shall, if there are excavations on either side of the same, be protected by substantial railings which shall be built and maintained thereon so long as such excavations continue to exist. It is not intended hereby to prohibit the maintenance of a driveway for the delivery of material across such sidewalk from the curb line to the building site.

Sec. 1115. (**Sidewalks.—Delivery of Material.—Elevated Sidewalks.**)—It shall be permitted for the purposes of delivering material to the basements of buildings in process of erection to erect elevated temporary sidewalks to a height of not exceeding four feet above the curb level of the street; and in case a sidewalk is so elevated, it shall be provided with good, substantial steps or easy inclines on both ends of the same and shall have railings on both sides thereof.

Sec. 1116. (**Sidewalks.—Temporary Roof Over.—Time Maintained.**)—If the building to be erected is more than four stories in height, and is set at or near the street line, there shall be built over the adjoining sidewalk a roof having a framework and covering composed of supports and stringers of three by twelve timbers, not more than four feet from centers, covered by two layers of two-inch plank.

Such roof shall be maintained as long as material is being used or handled on such street front and above the level of such sidewalk.

In all cases such temporary sidewalks and their railings and approaches, and the roofs over the same, shall be made, as regards ease of approach, strength and safety, to the satisfaction of the Commissioner of Buildings.

Sec. 1117. (**Street.—Storage of Building Materials.—Limitations.**)—The occupation of the street for the storage of building materials, or for temporary sidewalks, shall never exceed, in front of any one building, one-third of the width of the roadway of the same, and in no event shall any material be stored or placed within four feet of any street or steam railway track.

Sec. 1118. (**Sidewalks and Street.—Excavated Material and Rubbish On.—How Cared For.**)—Earth, other than sand to be used in the construction of the building, taken from excavations, and rubbish taken from buildings shall not be stored either upon sidewalks or roadways of streets, and shall be removed therefrom from day to day as rapidly as produced. When dry rubbish, apt to produce dust, is being handled, it shall be kept wetted down so as to prevent its being blown about by the wind.

Sec. 1119. (**Derricks.—Limitations.**)—For all buildings more than four stories in height, the use of derricks set upon the sidewalk or street is prohibited. In no case shall the guy lines be less than fifteen feet above the roadbed.

Sec. 1120. (**Frontage Adjacent.—How Occupied for Building Purposes.**)—If the written consent and a waiver of claims for damages against the city of the owners of properties abutting upon the site of any proposed building is first obtained and filed with the Commissioner of Public Works, the permission to occupy the roadway and the sidewalk may be extended beyond the limits of such building in front of the property for which the consent of the owner or lessee thereof has been secured, upon the same terms and conditions as those herein fixed for the occupation of sidewalk and street in front of the building site.

Sec. 1121. (**Street, Use of, for Building Purposes.—When Terminated.**)—Streets and sidewalks may be occupied for the purposes of building only in connection with the actual erection, repair, alteration or removal of buildings, and permission for such occupancy shall terminate with the completion of such operation. It shall be unlawful to occupy any sidewalk or street after the completion of the operation for which a permit has been issued by the Department of Buildings. It shall also be unlawful to occupy a

sidewalk or street, under authority of such permit, for the storage of articles not intended for immediate use in connection with the operations for which such permit has been issued.

**Sec. 1122. (Red Lights.)**—Red lanterns shall be displayed and maintained during the whole of every night at each end of every pile of material in any street or alley and at each end of every excavation.

**Sec. 1123. (Street Obstructions.—Permits.—Bonds.—Fees.)**—Permits for the obstruction of streets shall be issued by the Commissioner of Public Works and shall be paid for, in proportion to the street frontage occupied, at the rate of two dollars per month for each twenty-five feet of frontage so occupied.

No permit shall be issued until the applicant therefor shall have executed and filed with the Commissioner of Public Works a bond, with sureties to be approved by said Commissioner, and in an amount to be designated by him (in no case to be less than ten thousand dollars), conditioned to indemnify, save and keep harmless the city from any and all loss, cost, expense or liability of any kind whatsoever which it, the city, may suffer or be put to or which may be recovered from it from or by reason of the issuance of such permit, or by reason of any act or thing done under or by virtue of the authority given in such permit.

## ARTICLE XXIII.

### BILLBOARDS AND SIGNS.

**Sec. 1124. (Billboards or Signs on Buildings.)**—Every billboard or sign of greater height than two feet and placed on any building above the level of the ground shall be made wholly of incombustible material and shall be securely anchored and fastened in a manner satisfactory to and approved by the Commissioner of Buildings.

No billboard or sign anchored to, fastened to or situated above or upon the roof of any building shall be constructed so that the bottom of such billboard or sign shall be less than one foot or more than six feet above the surface of such roof, and no such billboard or sign shall exceed eight feet in height or be more than one hundred square feet in superficial area.

No billboard or sign such as is described in this section, whether anchored to or fastened to any building, or situated or located upon the roof thereof, shall be constructed or put in place unless in accordance with plans and specifications which have been submitted to and approved by the Commissioner of Buildings.

Billboards or signs made of incombustible material attached to buildings shall not be of greater height than two feet, and shall be erected, constructed and maintained in a manner satisfactory to and approved by the Commissioner of Buildings.

**Sec. 1125. (Size.—Construction.—Exception.)**—All signs or billboards other than those painted on or erected upon any building shall be limited in their superficial area to one hundred square feet, and shall be constructed of sheet or galvanized iron or some equally incombustible material, and such signs or billboards shall not be located nearer than twenty-five feet back of the front line of the lot whereon the same are to be erected. All such signs or billboards shall be securely anchored or fastened so as to be safe and substantial.

**Sec. 1126. (Height and Distance from Ground.)**—No such sign or billboard shall be constructed at a greater height than ten feet above the level of adjoining streets, and the base of the sign or billboard shall be in all cases at least three feet above the level of the adjoining streets. In case the grade of adjoining streets has not been established, no sign or billboard shall be constructed at a greater height than ten feet above the surface of the ground.

**Sec. 1127. (Wooden Billboards or Signs.—Construction.—Size.)**—Billboards or signs not exceeding twelve square feet in area may be built of wood or other combustible material, and such signs shall be exempted from the provisions of this article.

**Sec. 1128. (No Billboard or Sign to Be Erected Without Permit.)**—No billboard or sign such as is described in this article shall be erected, constructed or maintained within the city unless a permit shall first have been secured by the person desiring to erect, construct or maintain such billboard or sign, from the Commissioner of Buildings. Application for such permit shall be made in writing and shall be accompanied by such plans and specifications of the proposed billboard or sign as are necessary to fully advise and acquaint the said Commissioner with the construction of such proposed billboard or sign. If the plans and specifications accompanying such application shall be in accordance with the provisions of this

article, said Commissioner shall thereupon issue a permit for the erection or construction of such billboard or sign, upon the payment by the applicant of a fee as hereinafter fixed.

**Sec. 1129. (Alteration and Repair of Billboards.)**—No material alteration or repair of any billboard or sign shall be made, except upon a written permit issued by the Commissioner of Buildings authorizing such alteration or repair, and such permit shall be issued upon application in writing made to such Commissioner by the owner of such billboard or sign or by the person in charge, possession or control thereof, accompanied by a plan or written statement of the proposed alterations and repairs to be made, which, if satisfactory to and approved by the Commissioner of Buildings, shall authorize such applicant to receive a permit upon payment of a fee therefor as hereinafter fixed.

**Sec. 1130. (Billboards Now Existing to Be Altered to Comply With the Provisions of This Article.)**—Every now existing billboard or sign, whether erected upon or above the roof of any building or attached or fastened to the wall or walls of any building, or standing upon or erected upon any lot or premises, which is not erected or maintained in compliance with the provisions of this article, shall be forthwith removed or altered, changed or cut down so as to fully comply with such provisions; and any billboard or sign now existing and not complying with the provisions of this article, which shall not have been removed or torn down or so altered and changed within sixty days from and after the passage of this ordinance, as to be brought into conformity with the provisions of this article by the owner thereof or by the person in charge, possession or control thereof, shall be torn down by the Commissioner of Buildings and the cost and expense of tearing down and removing such billboard or sign shall be charged to the owner of such billboard or sign or the person in charge, possession or control thereof, and shall be recovered from such person for the use of the city by any proceeding deemed appropriate therefor.

**Sec. 1131. (Duty of Commissioner.)**—It shall be the duty of the Commissioner of Buildings to inspect all plans and specifications submitted in connection with the erection or construction or the alteration or repair of any billboard or sign, and to approve the same if the method of construction and provisions made for fastening, securing, anchoring and maintaining such billboards or signs are such as will serve to protect the public and to render such billboards or signs safe and substantial. It is further made the duty of the Commissioner of Buildings to exercise a supervision over all billboards and signs erected or being maintained under the provisions of this article; and whenever it shall appear to said Commissioner that any such billboard or sign is in an unsafe condition or has become unstable or insecure or in such a condition as to be a menace to the safety of the public he shall thereupon issue or cause to be issued a notice in writing to the owner of such billboard or sign or the person in charge, possession or control thereof, if the whereabouts of such person is known, informing such person of the condition of such billboard or sign and directing him to make such alterations or repairs thereto, or to do such acts or things as are necessary or advisable to place such billboard or sign in a safe, substantial and secure condition. If the person so notified shall refuse, fail or neglect to comply with and conform to the requirements of such notice, said Commissioner shall tear down or cause to be torn down and removed such billboard or sign, and shall charge the expense of such tearing down or removal to the person so notified. If the owner of such billboard or sign or the person in charge, possession or control thereof cannot be found, or his whereabouts is not easily ascertained, the Commissioner shall attach or cause to be attached to such billboard or sign a notice of the same import as that required to be sent to the owner, where such owner is known, and if such billboard or sign shall not have been placed in a secure, safe and substantial condition, in accordance with the requirements of such notice, within thirty days after such notice shall have been attached to such billboard or sign, it shall be the duty of the Commissioner of Buildings to thereupon order such billboard or sign torn down and removed.

**Sec. 1132. (Fees for Permits.)**—The fee to be charged for permits issued for the erection or construction of billboards or signs or for the alteration or repair thereof shall be two dollars for each billboard or sign.

**Sec. 1133. (Penalty.)**—Any person or corporation owning, operating, maintaining, or in charge, possession or control of any billboard or sign within the city, who shall neglect or refuse to comply with the provisions of this article or who erects, constructs or maintains any billboard or sign that does not comply with the provisions of this article, shall be fined not less than twenty-five dollars nor

more than two hundred dollars for each offense and each day on which any such person shall permit or allow any billboard or sign owned, operated, maintained or controlled by him to be erected, constructed or maintained in violation of any of the provisions of this article shall constitute a separate and distinct offense.

Sec. 1134. (**Fences.—Height of.**)—No wooden fences shall be constructed of greater height than eight feet above the sidewalk grade, or eight feet above the surface of the ground, where no grade is established.

## ARTICLE XXIV.

### STORAGE OF OILS.

Sec. 1135. (**Storage of Oils.—Buildings for Storage of Oils.—Walls.—Roof.—Floor.**)—Buildings designed for the storage of crude petroleum, gasoline, naphtha, benzine, camphine, carbon oil, spirit gas, burning fluid, spirits of turpentine, or coal, rock or earth oil (excepting such refined oils as will stand a fire test of one hundred and fifty degrees Fahrenheit according to the method and direction of John Tagliabue), shall be constructed as follows:

The walls shall be of brick, stone, or concrete, and shall be not less than sixteen inches thick or more than sixteen feet high. The lower floor of such buildings shall be at least three feet below the grade of the adjoining street and shall be made of earth, concrete or brick. The roof of such buildings shall be made of tile, metal or other incombustible material, and the outside walls of any such building having a flat roof shall extend at least eighteen inches above the roof. The coping upon the roof of such buildings shall be made of incombustible material. Such buildings shall be detached from all other buildings and shall be properly ventilated. Where any such building shall be located less than twenty-five feet away from any other building or structure, the wall or walls of such building on the side or sides thereof, within such distance of twenty-five feet from any other building or structure shall have no window or other opening therein; provided, however, that if such building cannot be so constructed that no outside wall thereof shall be less than twenty-five feet away from any other building or structure, in such case, openings may be made in the wall of such building which is located farthest away from any other building or structure for the purpose of admitting light or providing means of access thereto or egress therefrom. If such opening be a window, the glass in such window shall be fire-resisting glass, and such window shall be provided with a steel shutter.

No such building shall be occupied for any purpose other than the storage of oils, and no person shall be permitted to use any such building as a sleeping apartment or dwelling place.

The interior cubic capacity of any such building shall exceed by at least twenty-five per cent the total capacity of the tanks or other receptacles placed in such building.

Such buildings and the equipment thereof, including the protection of the doors and windows, shall be constructed according to plans and specifications which have been submitted to and approved by the Commissioner of Buildings.

Sec. 1136. (**Tanks for Storage of Oils.**)—Tanks for the storage of any one or more of the oils or fluids mentioned in the preceding section may be built outside of buildings either above or under the surface of the ground, provided the following specifications are complied with:

Such tanks shall be made of metal of sufficient gauge and tensile strength for the purpose for which they are to be used. All portions of such tanks are to be riveted together and shall be made liquid tight. Every such tank shall have a manhole and shall be equipped with adequate ventilating or safety devices.

All tanks other than those located in buildings constructed under the provisions of Section 1135 of this article, whether placed above or below the surface of the ground, shall have no building or structure of any kind whatsoever over or above the same; provided, however, that if any such tank be located near a railroad track or manufactory or place where sparks are likely to fall, and it is desired, in order to obviate such danger, to construct over such tank a shed or shelter. Such shed or shelter may be constructed upon a permit in writing therefor being issued by the Commissioner of Buildings; and such permit shall only be issued if it shall be shown that such shed or shelter is necessary and upon the express agreement that such shed or shelter shall be used for no other purpose than affording protection or shelter, and shall not be used for storage, manufacturing, residence, office, or any other purpose whatsoever.

**Sec. 1137. (Walls Around Tanks.)**—Where any such storage tank or any portion thereof is erected or maintained upon or above the surface of the ground and is situated less than fifty feet from any other building or structure other than the buildings or structures upon the premises wherein such oils or fluids are to be used or stored, such tanks shall be separated from any such building or structure by an inclosing wall of brick, stone or concrete; and such wall shall be not less than five feet high and in no case of less height than two feet higher than the top of the tank which it is designed to separate from such building or structure. If such wall be ten feet high or less it shall be not less than twelve inches in thickness, and four inches in thickness shall be added for every additional ten feet or major fraction thereof of height added to such wall. Such wall shall entirely surround or inclose such tank; provided, however, that an opening may be constructed in such inclosing wall to permit access to the tank. Such opening shall contain a liquid-tight door made of incombustible material, either sliding or opening inward, and of sufficient strength to resist any pressure which may be brought to bear on such door by the bursting of the tank inclosed in such wall.

All such tanks and walls described in this section shall be constructed in accordance with plans and specifications which shall have been submitted to and approved by the Commissioner of Buildings.

**Sec. 1138. (Storage of Petroleum, Etc.)**—It shall be unlawful for any person or corporation to keep or store crude petroleum, gasoline, naphtha, benzine, camphine, carbon oil, spirit gas, burning fluid, spirits of turpentine, or coal, rock or earth oil (excepting such refined oils as will stand a fire test of one hundred and fifty degrees Fahrenheit, according to the method and direction of John Tagliabue), upon or in any structure or premises, in any quantity exceeding one barrel of fifty gallons, within the city, except in such a building or such tanks as are hereinbefore described in this article, and where a quantity of any of such oils exceeding five gallons and not exceeding fifty gallons is kept in any premises other than such a building the receptacle or receptacles in which such oils is or are kept shall not be placed under any stairway or in any confined space, but shall be kept in such manner that no vapor or gas therefrom can collect in such a quantity as to become dangerous; and no such receptacle or receptacles shall be stored, kept or handled at any time within fifteen feet of any gas, candle, oil or other like artificial light or near any lighted stove, gas grate or any open flame of any kind whatsoever; provided, however, that a quantity of such oils exceeding one barrel of fifty gallons and not exceeding five barrels of fifty gallons each may be kept or stored in a room or apartment, the floor of which shall be at least five feet below the grade of the street adjacent to the building or structure in which such room or apartment is located, and such room or apartment shall have an air capacity of not less than fifteen hundred cubic feet and shall be properly ventilated in such manner as to prevent a dangerous accumulation of vapor or gas from such oils; and such room or apartment shall not be used for any purpose other than the storage and handling of such oils. In any such room or apartment as is last above described turpentine may be kept in a quantity not exceeding five hundred gallons.

No gas, candle, oil, or other like artificial light or lighted stove, gas grate, or other open flame of any kind whatsoever shall be allowed within fifteen feet of any receptacle of receptacles containing any of the oils or fluids mentioned in this article, while located, kept, or stored in any such room or apartment. If more than fifteen (15) barrels of any of the oils hereinbefore described are kept in any such building as herein provided for, such building shall be located not less than 100 feet away from any other building or structure.

**Sec. 1139. (Petroleum, Etc., in Transit Not to Be Kept Near Buildings.)**—It shall be unlawful for any person or corporation engaged in the business of transporting or delivering any of the oils or fluids mentioned in this article to permit such oils or fluids to remain in barrels, tanks, or other like receptacles, upon any railroad track, street, wharf, or dock for a longer time than is reasonably necessary to make provision for the storing or delivering of same; such time in no event, however, to exceed twenty-four hours.

**Sec. 1140. (Oils, Sale of, Regulated.)**—It shall be unlawful for any person or corporation to sell, deliver, or receive any of the oils or fluids mentioned in this article, by gas, candle, oil, or other like artificial light.

## ARTICLE XXV.

### MISCELLANEOUS PROVISIONS.

**Sec. 1141. (Roofs for Spectatorial Purposes.—Permits.)**—It shall be unlawful for any person, whether owner, lessee, manager or person in control or having charge of any building within the city, to permit the use of the roof of any house or building, whether free of charge or through admission fee, to any person as a place of observation or for spectatorial purposes, unless he has first obtained from the Commissioner of Buildings of the city a permit; provided, however, it shall not be unlawful for any person, whether, owner, lessee, or the person in control or having charge of such house or building, to permit the roof of any such house or building to be used as a place of observation or for spectatorial purposes for a number of persons not exceeding ten, and when no admission fee is charged.

**Sec. 1142. (Inspection as to Safety of Buildings.)**—Before issuing the permit, as provided for in the foregoing section, the Commissioner of Buildings shall make an investigation as to whether such building is safe and secure enough to permit the presence of an estimated number of persons upon the roof thereof, and the permit so issued shall state the number of persons to be permitted on such roof. The Commissioner of Buildings shall see to it that every such roof is surrounded and enclosed with a railing or balustrade of sufficient height and strength to afford adequate protection.

**Sec. 1143. (Fee for Inspection.)**—The person requiring such permit, as hereinabove provided for, shall make application to the Commissioner of Buildings for such an investigation, and shall pay, as a fee for such investigation and such permit, the sum of five dollars.

**Sec. 1144. (Penalty.)**—Any person, whether owner, lessee, manager or person having charge or control of any such house or building within the city who shall permit, allow or tolerate the use of the roof of such house or building so controlled by him, by any person for a purpose within the meaning of Section 1141 of this article, without first obtaining a permit as hereinbefore provided for, and without having the safety of such roof tested and investigated by the Commissioner of Buildings, as hereinbefore provided for; or who shall permit a larger number of persons than is provided for in his permit to congregate upon such roof, shall be fined not less than twenty-five dollars nor more than one hundred dollars for each offense.

**Sec. 1145. (Windows, Cleaning of.—Safety Devices.)**—The owner or agent of every building hereafter erected in the city shall equip each and every window in any such building, above the second story thereof, with a suitable device or devices which will permit the cleaning of the exterior of each and every window in such building, above the second story, without danger to the person cleaning such windows, such devices shall be of such pattern and construction as will reasonably answer the purposes for which they are intended. Provided, however, that if windows are of such size that they may be easily cleaned from the inside, they need not be equipped with such devices.

**Sec. 1146. (Penalty.)**—Any owner or agent of any building described in the preceding section who shall fail, neglect or refuse to comply with any of the provisions of such section, shall be fined not less than ten dollars nor more than fifty dollars for each offense, and each and every day which shall be allowed to elapse before any such building shall be supplied and equipped in accordance with the provisions of said section, shall constitute on the part of the owner or agent of any such building a separate and distinct offense.

**Sec. 1147. (Scaffolds.—Protection During Building Operations.—Temporary Floors.)**—All scaffolds erected in this city for use in the erection, repair, alteration or removal of buildings, shall be well and safely supported, and of sufficient width, and properly secured, so as to insure the safety of persons working thereon or passing under, or by the same, and to prevent the falling thereof, or of any material that may be used, placed or deposited thereon.

It shall be the duty of every owner, person or corporation who shall have the supervision or control of the construction or remodeling of any building having more than three (3) framed floors, whether some or all of such floors are above or below the established street grade, to provide and lay upon the upper side of the joists or girders, or both, of the first floor below the riveters and structural steel setters, a plank floor, which shall be laid to form a good and substantial temporary floor for the protection of employes and all persons engaged above or below or on such temporary floor in such building.

Provided, however, that where the permanent floor is in place on the floor herein required to be planked, a temporary protective floor shall not be required.

If the floor or permanent floor of the second floor, or of any other floor above the second, or roof, is being placed previous to the permanent floor of the floor immediately below the floor which is being arched or planked, a good and substantial temporary floor shall be laid on the joists and girders of the next lower floor. For the purposes of this section the lowest framed floor in a building shall be considered the first floor.

In buildings more than three (3) stories high, where persons are working on a scaffold or scaffolds on the outside of such building, such persons shall be protected by well-secured planking, set over the heads of such persons for the full width of the scaffolding on which they are working, if another story or other stories are being raised above such persons during the time they are working on such outside scaffold or scaffolding.

It shall be the duty of all owners, contractors, builders or persons having the control or supervision of all buildings in course of erection which shall be more than thirty (30) feet high, to see that all stairways, elevator openings, flues and all other openings in the floors shall be covered or properly protected.

**Sec. 1148. (Penalty.)**—Any person violating any of the provisions of the foregoing section shall be fined not less than one hundred dollars nor more than two hundred dollars for each offense, and any permit granted for the construction of such building by the authorities of the city may be revoked in the discretion of the Commissioner of Buildings.

**Sec. 1149. (Gas or Electric Shut-off Device.—Outside of Building.)**—Every building within the city in which gas or electricity is used for illuminating, heating or other purposes shall be equipped with a device or devices which will enable firemen to shut off the supply of gas or current of electricity to any such building from the outside thereof; such device or devices to be placed at such a point or at such points on the outside of any such building as may be designated by the Fire Marshal of the city, and to be of such design and construction as to enable such device or devices to perform with reasonable certainty and safety the work required to be done thereby.

Any device or devices installed for the purpose of carrying out the provisions of this section shall first be approved by the Fire Marshal, and after the installation thereof the control of any such device or devices so installed in or upon any building under the provisions of this section shall be under the supervision of the Fire Department of the city.

Provided, however, that buildings used exclusively for residence purposes and outbuildings, sheds or barns attached or appurtenant to buildings used exclusively for residence purposes, shall be exempted from the provisions of this section.

**Sec. 1150. (Penalty.)**—Any owner, agent or person having control or charge of any building coming within the provisions of the foregoing section, who shall neglect, fail or refuse to equip any such building with a device or devices such as are described in the foregoing section, shall be fined not less than fifty dollars nor more than two hundred dollars for each offense, and each day which shall elapse before the equipment of any such building with a device or devices as herein required shall be deemed a separate and distinct offense, and any person who shall disturb, meddle or tamper with any device or devices installed under the provisions of the preceding section, upon any building or buildings, without authority from the Fire Marshal, shall be fined not less than ten dollars nor more than one hundred dollars for each offense.

**Sec. 1151. (License.—Contractors.)**—Every person or corporation engaged within the city in the construction or repairing of the whole or any part of buildings and appurtenances shall be and he or it is hereby required to obtain a license from the city which shall permit him or it to engage thereafter in the business of contracting for the erection of buildings and appurtenances or parts thereof.

**Sec. 1152. (Application.—Conditions.)**—Every application for such license shall be made to the Commissioner of Buildings and shall set forth the name and residence or place of business of the applicant and the nature of the work which he or it desires to engage in for a period of one year thereafter, and shall be accompanied by a fee of two dollars.

**Sec. 1153. (License to Be Issued.)**—Said Commissioner shall thereupon issue a license in due form, permitting the applicant to engage in the business of contracting for the erection of buildings and appurtenances, or parts thereof, in the city for one year from the date of such license, which date shall be the first day of May in the year in which such license is applied for, and no license shall be granted for

any period less than a year, and all licenses shall run from the first day of May in each year until the thirtieth day of April in the succeeding year.

**Sec. 1154. (Penalty.)**—Any person or corporation who shall engage in the business of building in the city under contracts for the whole or any part of buildings and appurtenances, without first having obtained a license therefor as aforesaid, shall be fined not less than twenty-five nor more than one hundred dollars for each offense.

**Sec. 1155. (Walls.—Structures.—Buildings Altered to Conform to Chapter.)**—No wall, structure, building or part thereof shall hereafter be built, constructed, altered or repaired within the city except in conformity with the provisions of this chapter. No building already erected or hereafter to be built within the city shall be raised, altered or built upon in such a manner that if such building were wholly rebuilt or constructed after the passage of this ordinance it would be in violation of any of the provisions of this chapter.

**Sec. 1156. (Buildings.—Expense of Altering Recoverable from Owner by City.)**—Whenever, in the opinion of the Commissioner of Buildings, it shall be necessary to tear down, alter, repair or rebuild any building or portion of any building which is dangerous, defective or unsafe, or which is reported to the said Commissioner by the Commissioner of Health to be unfit for human occupancy, or which has been built in violation of any of the provisions of this chapter or of any ordinance regulating the construction of buildings hereafter passed, said Commissioner of Buildings shall cause such building or such portion thereof to be torn down, altered, repaired or rebuilt, or such work to be done thereon as he may deem necessary to render such building, or such portion thereof, safe or fit for human occupancy, and the expense thereof shall be recoverable from the owner or owners of such building by any proceeding that may be deemed appropriate.

**Sec. 1157. (Penalty.—Fines for Violation of Chapter.)**—Any person or corporation who violates, neglects or refuses to comply with, or who resists or opposes the enforcement of any of the provisions of this chapter, shall be fined not less than twenty-five nor more than two hundred dollars for each offense, and every such person or corporation shall be deemed guilty of a separate offense for every day on which such violation, neglect or refusal shall continue; and any builder or contractor who shall construct any building in violation of any of the provisions of this chapter, and any architect designing or having charge of such building who shall permit it to be constructed, shall be liable to the penalties provided and imposed by this section.

**Sec. 1160. (Repeal of Prior Ordinances.—Exception.)**—An ordinance passed March 28, 1898, known as the "Building Ordinance," and all amendments thereto, is hereby repealed. Such repeal shall not affect any suit or action or proceeding had or commenced in any court before the date when this ordinance takes effect, nor any offense committed, nor any forfeiture, nor any penalty incurred, nor any suit or prosecution pending for the recovery of any fine or penalty incurred under said ordinance passed March 28, 1898, and its amendments so repealed hereby.

**Sec. 1161. (Style of Ordinance.—In Effect.)**—This ordinance shall be known as "The Chicago Building Ordinance of 1905," and shall take effect and be in force from and after its passage.

1154 to 1157—735 to 738, 1160 to 1161—

# SANITARY OR PLUMBING ORDINANCE.

Governing the City of Chicago, revised with amendment to June 18, 1906, with Section Numbers of the Municipal Code.

This is to certify that I have examined the proofs of the Sanitary Ordinance as published in the Handbook for Architects and Builders and find that it agrees with the official ordinances in operation in this office.

*Perry L. Hedrick.*

*Chief Sanitary Inspector.*

The numbers accompanying these sections are the numbers of the chapters in the revised municipal code passed March 20, 1905.

**1604. Certificate.** Any person now engaged in, or hereafter engaging in, or working at, the business of plumbing in the city, either as master plumber or employing plumber, or as a journeyman plumber, shall obtain a certificate as to his competency to engage in such business in such manner as is hereinafter provided.

**1605. Application—examination.** Any person now engaged in the business of plumbing, or who may desire to engage in such business, either as a master plumber or employing plumber, or as a journeyman plumber, shall make application to the board of examiners, hereinafter provided for, and shall, at such time and place as said board may designate, undergo such examination as to his qualifications and competency to engage in such business, or to continue to engage in such business, as the said board of examiners may direct. Said examination may be made, in whole or in part, in writing, and shall be of a practical and elementary character, sufficiently strict, however, to test the qualifications of the applicant.

**1606. Board of examiners.** There is hereby created a board of examiners of plumbers, consisting of three members, one of whom shall be the commissioner of health, who shall be (ex officio) chairman of said board of examiners; a second member who shall be a master plumber and a third member who shall be a journeyman plumber. Said second and third members shall be appointed by the mayor, by and with the advice and consent of the city council. Each of said second and third members so appointed shall, before entering upon the duties of his office, execute a bond to the city, in the sum of five thousand dollars with sureties to be approved by the city council, conditioned for the faithful performance of the duties of the office to which they have been appointed.

**1607. Secretary.** The mayor shall appoint, by and with the advice and consent of the city council, a secretary to said board of examiners, and it shall be the duty of said secretary to preserve and keep all records, books and papers which are required by law to be kept by, or filed with, said board, and to do and perform such other services as may be from time to time required by the said board of examiners. The person appointed secretary shall, before entering upon the duties of his office, execute a bond to the city in the sum of five thousand dollars, with sureties to be approved by the city council, conditioned for the faithful performance of the duties of his office.

**1608. Powers of board—fees.** Said board shall examine applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation; and if satisfied as to the competency of any such applicant, and upon payment to the city collector of the fee hereinafter provided for, shall issue a certificate to such applicant, authorizing him to engage in or work at the business of plumbing, either as master plumber or employing plumber, or as a journeyman plumber, as the case may be, and according to the terms of the application made by such applicant. The fee for the examination and certificate of a master plumber or employing plumber shall be five dollars, and for the examination and certificate of a journeyman plumber it shall be one dollar. All fees received for said examinations and certificates shall be paid into the city treasury.

**1609. Non-compliance with article—work not to be inspected.** Any plumber who has not complied with the provisions of this article and obtained the certificate described in section 1608, or a certificate from the board of examiners of plumbers of any other city, town or village in accordance with the provisions of an act of the legislature entitled "An Act to provide for the licensing of plumbers and to supervise and inspect plumbing," in force July 1, 1897, shall not be entitled to have his work inspected and approved by the department of health; and said department shall not inspect or approve any work done by any plumber who has not obtained such certificate.

1610. **Penalty.** Any person violating, neglecting or refusing to comply with any of the provisions of this article, shall be fined not less than five dollars nor more than fifty dollars for each offense, and in addition, the certificate issued as herein provided, may be revoked by the mayor, on recommendation of the commissioner of health.

1611. **Plumbers' bond.** No licensed plumber shall be permitted to make any alteration or repair to, or do any work in or about any pipe or pipes connected with any part of the city water works system, or with any pipe or sewer connected with the city sewer system, unless such plumber shall have executed to the city a good and sufficient bond in the penal sum of ten thousand dollars with sureties to be approved by the commissioner of public works, conditioned for the faithful observance and performance of all the ordinances of the city then in force or which may thereafter be in force concerning or regulating the water works system or the sewer system of the city, or concerning the making or maintaining of any connection or connections thereto or therewith; and conditioned further, to indemnify, save and keep harmless the city from any loss, cost, damage, expense or liability of any kind whatsoever which the said city may suffer or which may accrue against it, be charged to or recovered from said city from or by reason of anything done by such licensed plumber or by any servant, agent or employee of his in and about the making of any alterations or repairs to, or any work done in connection with any service pipe or pipes, water main or connection with the water works system of the city, or any drain or pipe or connection with the sewer system of the city, or which may arise from or by reason of any negligence on the part of such licensed plumber in not maintaining barriers and warning signals around any excavation or opening which has been made by him in any street, alley or public way, in pursuance of the work of repairing, altering or locating any service pipe or pipes or connection to or with the water works system of the city, or sewer system of the city; and conditioned further, to restore the surface of any street, sidewalk or roadway wherever the same shall have been disturbed by him in and about the doing of any work; and conditioned further to do so such work of restoration to the entire satisfaction and approval of the commissioner of public works.

No permit shall be issued to any plumber to do any work necessitating the disturbance of any street, alley or public way, or alteration, repairing or location of any service pipe or pipes connected with the water works system of the city, or any drain or pipe connected with the sewer system of the city unless such bond be in full force and effect and on file in the office of the commissioner of public works.

ARTICLE II.

Plumbing.

1612. **Permit for use of water.** All applications for permits for the introduction or use of water supplied by the city shall be made in writing upon printed forms furnished by the department of public works, the blanks to be specifically and properly filled in and signed by the owner or duly authorized agent of the owner, and no work whatever shall be done in the street, or outside a building, by any plumber or other person for the purpose of making any connection to or with any city water main or pipe until after the issuance of such permit. This restriction shall not prevent any person from rendering assistance in case of accident to water pipes occurring at night, or at any time requiring immediate action. In case of any such accident prompt report thereof shall be made at the department of public works by the person rendering such assistance.

1613. **Tapping street main.** No person except the tappers employed by the department of public works shall be permitted under any circumstances to tap any street main, or insert stop-cocks or ferrules therein; all service cocks or ferrules must be inserted at or near the top of the street main, and not in any case nearer than six inches from the bell of the pipe; the size of the cock to be inserted shall be that specified in the permit.

1614. **Lead pipe—weight.** No lead pipe shall be used in any work done under the authority of a license or permit issued by the city, except such as is known to the trade as "strong," and must weigh as follows:

Half-inch internal diameter.....	1 <sup>3</sup> / <sub>4</sub>	pounds per lineal foot.
Five-eighths in. internal diameter.....	2 <sup>1</sup> / <sub>2</sub>	" "
Three-fourths in. " " .....	3	" "
One inch " " .....	4	" "
One and one-fourth in. internal diameter.....	4 <sup>3</sup> / <sub>4</sub>	" "
One and one-half in. " " .....	6	" "
One and three-fourths in. " " .....	6 <sup>1</sup> / <sub>2</sub>	" "
Two inches " " .....	8	" "

No pipe shall be used for the purpose of street service of a different material or size than herein specified except by special permit.

**1615. Service pipe—joints.** All service pipes leading from street mains to the building line shall as far as practicable be laid in the ground to a depth of not less than five feet, and such pipe shall be laid in such manner and be of such surplus length as to prevent breakage or rupture by settlement, and all joints in such pipes shall be of the kind termed "plumber or wiped joints." The connections of pipe by the so-called "cup-joint" is prohibited.

**1616. Stop cocks.** As amended June 18, 1906: Every service pipe shall be provided with a stop cock for each consumer, easily accessible, placed beyond damage by frost and so situated that the water can be conveniently shut off and drained from the pipes.

**1617. Stop-cock—location and cover.** Such stop-cocks unless otherwise specially permitted shall be connected to service pipes within the sidewalk at or near the curb line of the same, and be inclosed in and protected by a cast iron box with a cover having the letter "W" of suitable size cast thereon; such iron box shall be of form and dimensions satisfactory to the commissioner of public works and shall extend from service pipe to surface of sidewalk, and be of proper size to admit a stop key for operating the stop-cock.

**1618. Single tap for several buildings—cocks.** Whenever two or more distinct buildings or premises are to be supplied by means of branch or sub-service pipes supplied by a single tap in the street main, each branch shall be independently arranged with stop-cock and box on the curb line in the manner above described. All cocks used at the sidewalks by plumbers shall be of the kind known as "round water way."

**1619. Opening and repair of streets—permit.** Before filling the trench the service cock in the street main shall be covered with a suitable cast iron box furnished by the city, the earth shall be well rammed under the main, to a level with the top thereof, from thence the trench shall be filled in layers of not more than twelve inches in depth, and each layer thoroughly rammed or puddled to prevent settlement. This work together with the replacing of sidewalks, ballast and paving shall be done in all cases by the city. A sufficient amount shall be deposited with the city before issuing the permit for opening the street to cover this expense. In all cases where the street to be opened has been recently paved with blocks, sufficient of the paving shall be removed so that the foundation boards or planks (if any), can be taken up without cutting. No permit shall be granted for the opening of any paved street for the tapping of mains or laying of service pipes, when the ground is frozen to a depth of twelve inches or more, except when in the opinion of the commissioner of public works there is a sufficient emergency to justify it.

**1620. Steam boiler supply tank.** As amended June 18, 1906: All persons are prohibited from connecting pipes whereby high pressure steam boilers may be supplied with water direct from city water mains. All such boilers shall be provided with a tank, or other reasonable or sufficient capacity to hold, at least, six hours' supply of water in case of a pipe district being shut off to repair water mains, or to make connections or extensions. In such cases the city will not be responsible for a lack of water for steam boilers, or for any purpose.

**1621. New plumbing—repairs—exposed pipes and traps—tests.** As amended June 18, 1906: In all buildings hereafter erected in the city, both public and private, and in all buildings already built or erected wherein any plumbing is installed or wherein any sewer connected pipe shall be repaired or changed, except for minor repairs, on the sewer side of the trap, the drain, soil, rainwater, when rainwater pipes are within building, waste pipes, or any other pipe or pipes connected directly or indirectly to any drain, soil, or waste pipe, and all traps, shall be placed within buildings and exposed to view for ready inspection and test, and shall remain so exposed until approved by the commissioner of health. In no case shall a trap be inaccessible at any time.

**1622. Metal connections—to be tested and approved.** All soil or waste pipes shall be connected to the tile sewer, if a tile sewer is laid within the building, and if the connection is made above the ground or floor, by a suitable metal connection, which shall make an air and water-tight joint, without the use of cement, mortar, putty, or other like material, and which can and shall be tested with water when in place. Such metal connections shall be in view at the time of final inspection.

The entire fitting or piece which is used to connect the iron soil or waste pipe to the tile sewer shall be regarded as the metal connection. Metal connections which can be removed from the sewer and soil or waste pipes, after once in place without removing a portion of the iron soil or waste pipe, are prohibited. No such metal connection shall be used which has not been submitted to and tested and approved by the chief sanitary inspector, and the commissioner of health. No tile sewer shall be used above the ground or cement floor or where a cement joint is exposed to the air. One of each such approved types of metal connections shall be kept in the sanitary department.

**1623. Connections outside buildings and under floors.** Outside of the building and under ground the connection between the soil or waste pipe and the vitrified tile sewer shall be thoroughly made with live portland cement mortar, made with one part cement and two parts clean, sharp sand.

An arched or other proper opening shall be provided in the wall for the house drain to prevent damage by settlement. The opening around the house drain may be filled with pure refined asphaltum.

**1624. Drains connected with sewers—adequate size.** It shall be the duty of every person or corporation connecting or causing to be connected any drain, soil pipe, or passage with any sewer from any building, structure, or premises to cause such drain, soil pipe, passage, and connection to be at all times adequate for its purpose and of such size and dimensions as to convey and allow freely to pass, whatever may properly enter the same.

All connections between metal pipes and between metal pipe and tile sewers shall be made by a plumber and in such manner as the commissioner of health shall direct.

**1625. Separate drainage for every building—exception.** Every building shall be separately and independently connected with a public or private sewer, where there is any such sewer in the street adjoining such building.

The entire plumbing and drainage system of every building shall be entirely separate and independent from that of any other building, except where there are two buildings on one lot, one in the rear of the other. If there is no sewer in the alley to which the rear building can connect the sewer of the first building may be extended to serve such rear building.

**1626. Kitchen slops, etc.—water supply.** All connections with sewers or drains used for the purpose of carrying off animal refuse from water-closets or otherwise, and slop of kitchens, shall have fixtures for a sufficiency of water to be so applied as to properly carry off such matters.

**1627. Size of soil pipe—increaser.** Every water closet located within any building shall waste into a pipe not less than four inches in diameter. Such pipe shall be increased below the roof line as hereinafter provided and shall be carried through and above the roof.

**1628. Definition of terms.** In this article the term "main soil pipe" is applied to any pipe receiving the discharge of one or more water closets, with or without other fixtures, and extending through the roof.

The term "branch soil pipe" is applied to any pipe receiving the discharge from one or more water closets and with or without other fixtures and leading towards and connecting with the main soil pipe, but not necessarily extending through the roof.

The term "waste pipe" is applied to any pipe receiving the discharge from any fixture or fixtures other than water closets.

The term "house drain" is applied to the pipe within any building which receives the total discharge from any fixture or sets of fixtures, and may or may not include rain water, and which conducts or carries the same to the house sewer. The house drain, when rain water is allowed to discharge into it, shall be not less than six inches internal diameter.

The term "house sewer" is applied to the tile sewer, which shall be not less than six inches internal diameter, and which begins outside of the wall of a building and connects the house drain with the public sewer in the street.

The term "main vent" is applied to the vertical line of air pipe running through two or more floors and to which the vent or revent pipes from the various floors are connected.

The term "vent pipe" is applied to any pipe provided to ventilate a system of piping, and to which the revents are connected.

The term "revent pipe" is applied to any pipe used to prevent trap siphonage and back pressure.

The term "soil" or "waste vent" is applied to that part of the main soil or waste pipe which is above the highest installed fixture waste connection and extends through the roof.

When sizes of pipes are specified the internal diameters of the pipes are meant.

**1629. Iron pipes—quality—weight.** All soil, waste, and vent pipes, except as hereinafter specified for lead branches and brass pipes, shall be either extra heavy cast iron pipe coated with tar or asphaltum or standard galvanized wrought iron pipe; provided, that wrought iron pipe coated with tar or asphaltum may be used for soil and waste pipes, but not for soil or waste vent or for vent or revent pipes. All pipes shall be sound and free from all holes, cracks, or defects of any kind.

The following weights per lineal foot will be accepted as complying with this chapter as to weight of extra heavy cast iron pipe:

Diameter.		
2 inches.....	5½	pounds per lineal foot.
3 ".....	9½	" " " "
4 ".....	13	" " " "
5 ".....	17	" " " "
6 ".....	20	" " " "
7 ".....	27	" " " "
8 ".....	33½	" " " "
10 ".....	45	" " " "
12 ".....	54	" " " "

Extra heavy cast iron pipe shall have the maker's name and the weight per foot clearly cast upon each section thereof.

The following weights per lineal foot are required for standard wrought iron pipe, galvanized, or tar coated pipe:

Diameter.		
1½ inches.....	2.68	pounds per lineal foot.
2 ".....	3.61	" " " "
2½ ".....	5.74	" " " "
3 ".....	7.54	" " " "
3½ ".....	9.00	" " " "
4 ".....	10.66	" " " "
4½ ".....	12.49	" " " "
5 ".....	14.50	" " " "
6 ".....	18.76	" " " "
7 ".....	23.27	" " " "
8 ".....	28.18	" " " "
9 ".....	33.70	" " " "
10 ".....	40.00	" " " "

**1630. Fittings—quality—cleanout fittings.** All fittings used for soil or waste pipe, except as hereinafter specified, shall be either extra heavy tar or asphaltum coated fittings or extra heavy galvanized, cast, or malleable iron, recessed and threaded drainage fittings. The burr formed by cutting the wrought iron pipe shall be carefully reamed out. Proper sized cleanout fittings shall be installed at each ninety degree intersection of soil or waste pipe.

**1631. Cleanout—No pipe to be tapped.** As amended June 18, 1906: On soil or waste pipes 4 inches or more in diameter heavy brass cleanouts, not less than 4 inches in diameter, shall be used. Where iron drain, soil, waste or vent pipes are drilled and tapped, brass plugs or brass soldering nipples shall be used.

**1632. Pipe joints, filling of.** All joints on cast iron soil, waste or drain pipes, and rain water leaders shall be so filled with picked oakum and molten lead and hand calked as to make them air and water tight. The quantity of lead used shall be twelve ounces of fine soft lead for each inch in the diameter of the pipe.

**1633. Floor rests on vertical lines.** As amended June 18, 1906: Vertical lines of soil, waste or other pipes, or rain water pipes when within buildings, shall be provided with floor rests at intervals of every second floor.

**1634. Pipe supports—pipe hooks prohibited.** The foot of every vertical soil, rain, or waste pipe shall be adequately supported by brick, stone, or concrete piers properly constructed by the use of cement mortar or cement concrete or otherwise equally well supported. Pipes under the basement floor or in the ground shall be properly laid, graded, and supported. Pipes above the floor shall either be adequately supported or suspended.

The use of pipe hooks for supporting pipes is prohibited. At the foot of each soil or waste pipe shall be placed a cleanout fitting, which shall be accessible at all times.

**1635. Prohibited fittings.** As amended June 18, 1906: No double hub or straight crosses shall be used on horizontal or vertical lines. The use of bands, saddles and sleeves are prohibited.

**1636. No calked pipe in vibrating buildings.** Pipes with calked joints shall not be installed in buildings subject to vibration from operating machinery or subject to other causes likely to loosen such calked joints.

**1637. Lead pipe—quality—not within partitions.** Lead pipe of a quality equal to "extra light" shall be used for water closet bends and as branches for vent, revent, and waste pipe connections.

Lead pipe used for vent or revent connections shall not extend into or be used within partitions.

**1638. Lead pipe connections—Wiped joints—brass pipes.** All connections between lead and metal pipes shall be made by heavy brass solder nipples, or heavy brass, or combination ferrules which have been approved by the department of health. All solder connections shall be regulation wiped joints. If brass pipe is used it shall be drawn tubing of No. 18, B. and S. gauge.

**1639. Straight tees prohibited.** As amended June 18, 1906: Straight tees for soil or waste pipes shall not be used.

**1640. Chimney ventilation of soil waste pipes prohibited.** No brick, sheet metal, earthenware, or chimney flue shall be used for a sewer ventilator or to ventilate any trap, soil, waste, or other sewer connected pipe or opening.

**1641. Iron pipe—where used.** Every soil, revent, vent and waste pipe shall be of iron, except as is specified herein for lead or brass pipe.

**1642. Vertical pipes through roof—increased how.** The vertical soil, waste, or vent pipes (where the vent or continuous waste pipe is not reconnected to a soil, waste, or vent pipe below the roof) shall extend through and above the roof at least eight inches and have a diameter of at least one inch greater than that of the pipe proper. But in no case shall it be less than four inches in diameter through and above the roof.

The increasers shall extend at least one foot below the roof. No cap or cowl shall be affixed to the top of any such pipe or pipes.

**1643. Pipes above main building—nuisance.** Soil, waste and vent pipes shall be carried above the roof of the main building when otherwise they would open within fifteen feet of the windows or doors of such or adjoining buildings and shall be not less than six feet from any ventilator or chimney opening of such or adjoining building or buildings; nor shall they be located so as to be a nuisance to the occupants of any building.

**1644. Soil and waste pipes extended—When.** As amended June 18, 1906: Except in office buildings and factories, branches of soil or waste pipe of 20 feet or more in length shall be extended full size, increased and carried through and above the roof. Branches of waste pipe less than 20 feet in length shall be either carried full size and increased and carried through and above roof or returned full size to main vent pipe. Vent pipes into which the revent pipe of rows of fixtures are connected shall be not less than 1½ inches in diameter for not to exceed three plumbing fixtures other than sink, urinal or water closets. For a greater number of such fixtures the vent pipe shall be at least two inches in diameter.

Where the vents from water closets and other plumbing fixtures are connected into the same vent pipe, the size of the vent pipe shall be at least two inches in diameter from the main vent pipe to the point of connection to the vent of the other fixtures, not requiring a two-inch revent.

**1645. Ejectors—ventilation—size of soil and wastes.** The soil or waste pipe leading to an ejector or other appliance for raising sewage or other waste matter to the street sewer, shall, where a water closet or closets are installed, be ventilated by a vent pipe not less than four inches in diameter. Where fixtures other than water closets are installed the waste pipe shall be ventilated by a vent pipe of the same diameter as the waste pipe. Soil vents, vents, and revents for ejectors shall be installed according to the provisions of this chapter governing soil, waste, vent, and revent pipes.

**1646. Prohibited pipes—Pitch or grade.** As amended June 18, 1906: Horizontal soil or waste pipes are prohibited. In all possible cases the pitch shall be ¼ inch to the foot, making the grade in the direction of the outflow.

**1647. Drainage fittings—Horizontal vents—Trapped vents.** As amended June 18, 1906: Where rows of fixtures are placed in line where galvanized wrought iron pipe is used for vents or revents, galvanized iron, malleable, or case iron fittings, or case iron drainage fittings, shall be used.

All vent fittings shall be either galvanized, tarred or asphaltum coated.

Horizontal vent pipes unless practical shall not be used. Lines of soil, waste, or vent pipes shall be run in a thoroughly workmanlike manner. Trapped or sagged, or drops in, vent or revent are prohibited. No vent pipe from the house side of any trap shall connect to any sewer, vent pipe, soil or waste pipe.

**1648. Continuous vents.** Trap revents shall be continuous where possible. Where the vent or revent pipes are continuous and traps are ventilated through the waste fitting, the center of the outlet of such fitting shall not be set below the water seal of the trap; and the trap shall not be more than three feet from the waste fitting.

No crown venting shall be permitted.

**1649. Size of soil and waste pipes.** The least diameter of soil pipe permitted is four inches. A vertical waste pipe into which a kitchen sink or sinks discharge shall be two inches in diameter and at least three inches in diameter if receiving the waste of five or more floors and shall have not less than one and one-half inch branches.

**1650. Trap prohibited—where.** There shall be no traps at the foot of soil or waste pipes, nor shall there be any trap upon the house drain or house sewer.

This section shall not prohibit the use of traps at the foot of rain water leaders or upon drains or sewers used exclusively for conducting rain water to a public sewer.

**1651. Trap revents—concealed partitions.** Every water closet, urinal, sink, basin, bath, and every laundry tub or set of laundry tubs, or any other plumbing fixture shall be effectively and separately trapped and revented, except as hereinafter provided for anti-siphon traps.

All traps shall be protected from siphonage by special vent or revent pipes, except where anti-siphon traps are permitted. Such revented trap shall not depend upon any concealed partition for its water seal.

**1652. Connected wastes.** A connected waste pipe receiving the discharge of not more than two basins, set in line, may waste into a single trap, which shall not be more than two feet from the waste outlet of one of the fixtures.

**1653. Floor washes—Bell traps prohibited—Back water valve.** As amended June 18, 1906: When floor washes are connected it shall be by means of a deep seal trap. Bell traps and cast iron S. and P. traps having covers over hand holes on the sewer side of the trap, held in place by lugs or bolts, are prohibited. Where a floor drain is placed in a basement it shall be protected from back sewage by means of some suitable and approved back water valve or stop. Covered floor gutters are prohibited.

**1654. Bath tub drum trap—revent.** Each bath tub shall be provided with a drum trap. Traps on bath tubs shall be placed in such a manner that the cleanout will be in plain view and above the floor.

The drum trap shall be revented through either a "TY," a "Y" or a drainage fitting.

**1655. Traps—placing of—water seal.** Traps shall be placed as near to the fixtures as possible, and in no case shall a trap be more than two feet from the waste outlet of its fixture.

All traps shall have at least a one and one-half inch water seal and they shall be set true with respect to their water level.

**1656. Waste to closet bend, etc., prohibited.** As amended June 18, 1906: In no case shall a waste pipe from any fixture be connected with any water closet trap, lead bend, vent or revent connection for same, except that a waste connection may be made to a lead bend in old or repaired work.

**1657. Water closet revent—size.** Water closets when placed within buildings shall have two-inch revents for each water closet trap, except as hereinafter provided.

**1658. Size of vents depends on stories.** As amended June 18, 1906: The main vent pipe for traps of water closets in buildings four stories or under shall be at least two inches in diameter and have two inch revents, except that revents for the traps of other plumbing fixtures may be the same diameter as waste traps. In buildings more than four stories high and not more than six stories high the main vent pipes for water closets with or without other plumbing fixtures shall be at least  $2\frac{1}{2}$  inches in diameter. In buildings more than six stories high and not to exceed 18 stories the main vent pipes for water closets with or without other plumbing fixtures shall be at least three inches in diameter. In buildings more than 18 stories high the main vent pipe for water closets with or without other fixtures shall be at least four inches in diameter. The main vent pipe for other fixtures than water closets in buildings four stories and under shall be at least two inches in diameter. In buildings more than four stories high and not more than eight stories high the main vent pipes shall be at least  $2\frac{1}{2}$  inches in diameter. In buildings more than eight stories high the main vent pipe shall be at least 3 inches in diameter, except that the diameter of the vent pipe may be reduced to  $2\frac{1}{2}$  inches for the six lower stories; Provided, that where the waste pipe for fixtures other than water closets exceeds 3 inches in diameter the main vent pipe shall be at least 3 inches in diameter. The size of revent to traps of plumbing fixtures other than water closets shall be at least the same size as waste to traps.

**1659. Vents—size of for twelve fixtures.** Where more than twelve closets are installed on any floor the vent pipe for the same shall be at least three inches in diameter with two-inch revents for traps.

For purposes of reventing, any four fixtures other than water closets (where the same are placed on one floor) shall be taken as equal to one water closet. This is to apply where water closets are revented through the same vent pipe.

**1660. Vents in residences.** Vent pipes for water closets in residences shall be two inches in diameter with same size branches, and for other fixtures not less than one and one-half inches in diameter with branches the same size as waste and trap; except that the vent pipe for a kitchen sink shall be two inches in diameter.

**1661. Size of waste pipes.** Where fixtures other than water closets are installed in a building more than four stories and basement or cellar high, having no soil pipe from ground in building to and through roof, and where the total number of fixtures wasting into one pipe exceeds six, the same shall waste into at least a two-and-one-half-inch pipe, which shall be carried through the roof; except that where a battery of urinals and no water closets are installed in any building (where a three-inch waste pipe is required) the same shall be carried at least three inches in diameter from the ground in the building up and through the roof.

**1662. In buildings under four stories.** In buildings of four stories and under, where no water closet is installed and where no sewer connected soil pipe is carried from ground in building to roof, the fixtures if six or more in number shall waste into a pipe at least two and one-half inches in diameter, which shall be carried through the roof.

Where a smaller number of fixtures is installed the main waste pipe shall be two inches in diameter and carried through the roof, except that where a battery of urinals having a three-inch waste pipe is installed the waste pipe shall be carried at least three inches in diameter from the ground in the building up and through the roof.

**1663. Vents reconnected.** All vents shall be either run separately through the roof or be reconnected to an increaser twelve inches below the roof or may be reconnected to the soil vent or main vent pipe, not less than three feet above the highest floor on which fixtures are placed; Provided, that no fixture or fixtures shall be placed on any floor or floors above and connected to the soil, waste, vent or revent pipes from the fixtures on floors below; nor shall any fitting or fittings for future connections be placed in any soil or waste pipe above the point of revent connection. Where fixtures are afterwards installed on other floors the vent and revent pipes of the fixtures already installed shall be rearranged to conform to the provisions of this chapter. Reconections will not be permitted where said vent pipes run through more than five floors.

**1664. Length of horizontal vent.** As amended June 18, 1906: Except in office buildings and in factories the vent pipes from any fixture or fixtures reconnected as hereinbefore provided, shall not span a horizontal distance to exceed 20 feet in length. In office buildings and factories this distance shall not exceed 40 feet.

**1665. Vent pipe increased.** Where a vent pipe is carried independently through the roof it shall be increased as provided for in preceding sections.

**1666. Prohibited use for revent.** No trap, revent, or vent shall be used as a waste or soil pipe.

**1667. Revents for adjoining fixtures.** As amended June 18, 1906: Where bath rooms are located on opposite sides of a wall and directly opposite each other and on the same floor in any building and have a common soil or waste pipe in the same separating wall, the revents from fixtures in either or both of such bath rooms may connect into the same pipe.

Where two plumbing fixtures other than water closets waste into a double "Y" or double "TY" fitting, a single proper revent connected at or near the junction of the two waste lines forming a part of the fitting will be permitted.

**1668. Safe wastes.** All lead or other safes where necessary under fixtures shall be drained by a special pipe, the same to discharge into an open water supplied sink or into a deep seal trap, and in no case shall the safe be connected with any waste, soil, or drain pipe or sewer. The ends of safe waste pipes shall be covered by flap valves.

**1669. Overflow pipes.** Overflow pipes from fixtures shall be in each case connected on the inlet side of the trap.

**1670. Refrigerator wastes—sizes—traps.** The waste pipe from a refrigerator or ice box shall not be directly connected with any soil, rain, or waste pipe or with the drain or sewer, or discharge upon the ground. It shall discharge into an open water supplied sink or over a deep sealed trap and shall be as short as possible and disconnected from the refrigerator or ice box by at least four inches; and where refrigerators or ice boxes are placed in buildings and upon two or more floors the waste

and vent pipe thereof shall be continuous and shall run through the roof, and in no case shall it open within six feet of an open soil or vent pipe.

The size of a waste pipe for refrigerators for two floors or less shall be at least one and one-half inches and two inches for three floors and over and under five floors, and two and one-half inches for five floors and over. Each refrigerator or ice box shall be provided with a suitable trap with an accessible trap screw or cleanout. Such trap shall be placed in the one-and-one-half-inch waste pipe and shall be near the refrigerator or ice box. Such traps need not be separately vented.

**1671. House boilers.** The sediment pipe from house boilers shall not be connected into the sewer side of any trap nor directly connected into any soil, waste pipe, or drain.

**1672. Flush tanks—purity of water.** All water closets and urinals within any building shall be supplied from special tanks or approved automatically flushing valves having flush pipes at least one and one-quarter inches in diameter. The water from such tanks or cisterns shall not be used for any other purpose. The purity of such water and of water used in all other plumbing fixtures shall be equal to the purity of the water supplied through the Chicago waterworks system.

**1673. Automatic flush tanks.** Flush tanks for urinals shall be arranged for intermittent and automatic discharges. All urinals shall be flushed at regular intervals not to exceed seven minutes each.

**1674. Cisterns for water closets—house tanks.** Where cisterns are used for water closets they shall each have a siphon discharge. The valves of such cisterns shall be fitted and adjusted so as to prevent a waste of water. When the city pressure is not sufficient to supply such cisterns or plumbing fixtures with water adequate pumps or house tanks shall be provided.

**1675. Water closets.** All water closets shall have flushing rim bowls.

**1676. Water closet flushing.** Water closets and urinals shall not be supplied from any water supply pipes direct. In a cellar or unfinished basement of a building already constructed and where there is danger from frost, sanitary long hopper closets may be installed if they are provided with individual frost proof flush tanks of approved types.

All closets shall be fitted with either siphon discharge flush or pressure tanks or approved automatically flushing valves not directly connected to the city water supply pipes.

All individual closets at each flush shall receive not less than four gallons of water into the closet bowl at each discharge, which shall be discharged in such time and with such force as shall thoroughly cleanse the closet bowl at each flush.

**1677. Long hopper closets—where not to be installed.** Long hopper closets shall not be installed in the cellar or basement or in any part of any building hereafter constructed.

**1678. Outside water closets—where.** A water closet shall not be installed on a porch or other like place. Outside water closets may be installed for buildings heretofore erected only.

**1679. Proximity to buildings.** Water closets when placed in the yard of any building heretofore erected shall be separately trapped and placed not less than eight feet from any dwelling or other place of abode and so arranged as to be conveniently and adequately flushed, and their water supply pipes and traps shall be protected from freezing. The compartments for such water closets shall be adequately lighted and ventilated.

**1680. Water closets under sidewalks.** As amended June 18, 1906: Where water closets or other plumbing fixtures are placed under a sidewalk, street, alley, or other like place, adjoining and opening into the basement of any building, each and every fixture so placed shall be ventilated in the same manner as provided for other plumbing fixtures in this chapter, and the water closet compartments shall be adequately lighted and ventilated.

**1681. Separate water closets—number of—where placed.** In all places of employment where men and women are employed separate and sufficient water closets shall be provided for males and females. Water closets for men shall be plainly marked "Men's Toilet" and water closets for women shall be plainly marked "Women's Toilet."

In all places of employment one water closet shall be provided for every twenty-five males or less number, and one water closet shall be provided for every twenty females or less number. Such water closet facilities shall be furnished upon at least every second floor. Where there are employees in any basement such basement shall be considered as one floor.

**1682. Water closets in lodging houses.** In lodging houses and hotels hereafter erected or altered there shall be provided one water closet for every twenty-five males or less number and one water closet for every twenty females or less number. The number of water closets required shall be determined from the number of lodging quarters provided. There shall be at least one closet on each floor. The general water closet accommodations of a lodging house shall not be placed in the basement.

**1683. Separate closets for business and residences.** In all buildings used jointly for residence and business purposes, separate and sufficient water closets shall be provided for the use of families and for the use of employes and patrons of the place.

**1684. Toilet paper.** No paper other than what is commonly known as toilet paper shall be placed in any water closet or allowed to enter any soil pipe.

**1685. House tanks, lining—overflow.** Tanks in which water to be used for drinking or other domestic purposes is stored shall not be lined with zinc or lead.

The overflow pipes from such tanks shall discharge upon the roof or be trapped and discharged into an open sink. Such overflow pipes shall not be connected into any soil waste pipe or other sewer connected pipe; nor shall the drain or sediment pipe be connected into any soil, waste pipe, or other pipe directly connected with a sewer.

**1686. Rain water leaders, trapped when.** Rain water pipes or leaders shall not be used as soil, waste, or vent pipes; nor shall any soil, waste, or vent pipe be used for a rain water pipe or leader. Where a rain water leader opens near any window, door, or vent shaft, or is so located as to render it likely to become a nuisance, if not trapped it shall be properly trapped far enough below the surface to prevent its becoming a nuisance or freezing.

Inside rain water leaders shall be made of extra heavy cast iron or tar or asphaltum coated wrought iron pipe or galvanized wrought iron pipe, with roof connections, made gas and water tight by means of heavy lead or copper drawn tubing, wiped or soldered to a brass ferrule, caked or screwed into the pipe. Outside rain water leaders may be of sheet metal but they shall connect with the house drain by means of a five-foot length of cast iron pipe extending vertically at least four feet above the grade level.

**1687. Steam pipe—blowoff basins—vent, etc.** No steam, exhaust, blowoff, drip, or return pipe from any steam trap shall connect with the sewer or with any house drain, soil, waste pipe, or rain water pipe. The water or steam of condensation from such pipes before it shall enter any sewer or drain shall be discharged into a suitable cast iron catchbasin or condenser, from which a special vent pipe not less than two inches in diameter shall extend through the roof.

**1688. Blowoff pipes—kind, etc.** Blowoff pipes from boiler or heating plants shall be either of extra heavy cast iron pipe or galvanized wrought iron pipe. No such blowoff or hot water pipe shall discharge directly or indirectly into any vitrified earthenware tile sewer within any building.

**1689. Temperature of water into sewer.** No water of a higher temperature than one hundred and twenty degrees Fahrenheit shall be permitted to enter any house sewer direct.

**1690. Area drains—traps—backwater valves.** When the area drains are connected to the house sewer or drain they shall be effectively trapped. Such traps shall be protected from frost.

**1691. Cellar drainer—ground water.** Cellars and basements shall be kept free from ground or surface water, and where the same are too low to be drained into the sewer the water therefrom shall be lifted by a cellar drainer or other device, approved by the chief sanitary inspector, and discharged into the sewer.

**1692. Floor washes in basements—indicated protection.** Floor washes for basements shall be provided with a deep seal trap, having a heavy strainer, and a backwater gate valve or stop, accessible for cleaning.

No backwater valve shall be used which has not been approved by the chief sanitary inspector.

All building plans, where basement floor washes are connected, shall indicate where and what backwater valve or device is to be used.

**1693. Sumps—tight cover.** Sumps or rodding basins for subsoil drains shall be provided with tight cast iron covers.

**1694. Prohibited sinks and tubs.** The installation of stationary wooden sinks and wooden laundry tubs is prohibited inside of any building used for human habitation. Such sinks and tubs shall be of non-absorbent material.

**1695. Catchbasins prohibited—when.** No catchbasin or gravel basin shall be allowed within any building, except as provided for in the following sections:

**1696. Kitchen wastes to catchbasin.** Kitchen or other greasy wastes shall be intercepted by a catchbasin or grease trap and thence conducted to the house sewer.

The vitrified tile sewer through which kitchen wastes are conducted shall be at least six inches in internal diameter.

**1697. Catchbasins, construction of.** Catchbasins for receiving such wastes shall be constructed either of brick, concrete, or cast iron. If of brick or concrete they shall be at least thirty inches internal diameter at the base and may taper to not less than twenty-two inches internal diameter at the top and be finished with a stone or iron cover at grade level.

The walls of such catchbasins shall be (if of brick) eight inches thick and laid in Portland cement mortar and plastered outside and inside with a half inch coat of Portland cement mortar in proportion of one part of Portland cement and two parts of clean, sharp sand.

The bottom shall be at least eight inches thick and of either brick laid in cement mortar or of Portland cement concrete. The brick used shall be hard burned sewer brick.

Where Portland cement concrete is used the walls shall be at least six inches thick and the concrete shall be made of one part of live Portland cement, three parts of clean, sharp sand and five parts of crushed stone free from dust and of sizes between one-fourth inch and one and one-half inches in largest diameter; and in addition the catchbasins shall be plastered inside and out as specified above for brick construction. Catchbasins shall be made water tight. No retempered cement shall be used.

The bottom of catchbasins shall be at least two feet below the invert of the outlet to the sewer.

The outlet shall be trapped to a depth of six inches below the invert of the outlet to the sewer, to prevent the escape of grease, by a hood or trap of brick and cement mortar, a hood of concrete or cast iron.

The invert of the inlet to the catchbasin, for kitchen wastes, shall be not less than two and one-half feet above the finished bottom of the catchbasin.

**1698. Catchbasin dispensed with—grease trap.** Where the building covers the entire lot the catchbasin for kitchen wastes may be dispensed with, provided that a suitable sized grease trap of approved construction is installed and provided with a water jacket through which shall circulate the water that is drawn for the general kitchen use. Such grease traps shall at all times be accessible for cleaning.

**1699. Defective catchbasins—rain conductor connection.** Rain water leaders may connect to catchbasins. Such leaders shall connect to a catchbasin when they conduct water from a gravel roof.

Defective and leaching catchbasins shall be rebuilt according to the above specifications.

**1700. Number of urinals in factories.** In all places of employment one urinal shall be provided for every seventy-five males or less number.

**1701. Construction—prohibited use.** The sides, back and base of every urinal stall placed within any building shall be of non-absorbent material. Urinal stalls having troughs set in the floors are prohibited. The top of the urinal base shall be set one and one-half inches above the finished floor level. Urinal troughs and sectional urinals, unless lipped and provided with suitable automatic flush tanks or approved intermittent and automatic flushing valves are prohibited. No sectional urinals shall be placed within a building or compartment which is subject to vibrations.

**1702. Urinal flush—prohibited materials.** Every urinal stall shall have an individual lipped sanitary urinal bowl.

The use of cast iron, galvanized iron, sheet metal or steel urinal bowls and trough is prohibited. Each urinal bowl shall be separately and independently trapped and shall have a waste pipe of at least two inches in diameter.

**1703. Automatic flushing of urinals.** Each and every urinal trough and urinal bowl shall be intermittently and automatically flushed with at least a one-gallon water flush for each urinal bowl or two-foot length of urinal trough and at intervals not to exceed seven minutes each during its period of use.

The flushing of all such urinal fixtures shall be by means of either approved intermittently and automatically operated flush tanks or by intermittently and automatically operated flushing valves protected against a vacuum by a ground seat check valve.

**1704. Urinal wastes—prohibited screens.** The waste pipe of a "battery" of not exceeding four urinals shall not be less than two inches in diameter. For batteries exceeding this number the waste pipe shall be at least three inches in diameter.

No wire or metal screen shall be placed in any urinal bowl, unless every part of such screen is thoroughly washed at each water flush.

**1705. Revent omitted—When.** As amended June 18, 1906: Where a single water closet or other plumbing fixture is located in a building or on the top floor of any building, and there is an adequate soil or waste pipe of undiminished size from ground (in building) to roof, the revent pipe may be dispensed with; Provided, that for water closets a non-siphoning trap tested and approved by the Chief Sanitary Inspector, or a closet of approved construction is used for such work; and provided, further, that the trap of such fixture is located not more than five feet from such soil or waste pipe.

**1706. Revent omitted, when.** Where a toilet or bath room having not more than one closet and three other fixtures therein is located on one floor only or the top floor of any building, and such closet is set not more than five feet from the vertical soil pipe, the revent for the closet may be omitted; Provided, that a closet of an approved construction is installed.

**1707. Vent pipes reconnected—exception.** Vent pipes shall be reconnected to main soil and waste pipes or drain by a "Y" branch below the lowest fixture, and in such a manner as to prevent accumulation of rust. This shall not apply where there is a battery of fixtures on one floor only and no other fixtures on floors above or below.

**1708. Open Plumbing.** All plumbing fixtures shall be installed as open plumbing.

**1709. Prohibited closets—removal.** Pan, plunger, offset, wash-out-range closets and washout latrines shall not be allowed in any building; nor shall hopper closets be installed in any building hereafter erected. Such closets when found to be a nuisance shall be removed, or when the same are removed for repairs they shall not be again installed. In alteration work pan and plunger closets shall be removed.

Range closets of types approved by the commissioner of health and the chief sanitary inspector may be installed in factories and workshops only, and such closets shall be installed in separate compartments as hereinbefore provided for water closet compartments.

**1710. Reventing washout closets.** Where individual washout closets are installed they shall be revented above the floor line. Rubber connections or connections of like material shall not be used on any sewer connected pipe.

**1711. Prohibited fixtures not reinstalled.** No fixture shall be installed and no fixture shall be reconnected or reinstalled where it does not meet the requirements of this chapter.

**1712. Earthenware trap connections—How made.** As amended June 18, 1906: All earthenware and closet traps shall be connected to waste or soil pipes by inserting heavy brass floor or wall flanges, not less than  $\frac{1}{4}$  inch in thickness where lead bends are used, and shall be soldered to the same, and bolted to the trap flange.

Where brass or iron bends are used, brass or iron flanges not less than  $\frac{1}{4}$  inch in thickness may be used, and shall be screwed or calked to the same and bolted to the trap flange, and all such joints shall be made tight without the use of putty, cement, plaster, rubber, or leather washers. The use of putty, cement, plaster, rubber or leather washers is hereby prohibited in making all connections between traps of plumbing fixtures and soil or waste pipes.

No flange, iron bend or gasket connection shall be used until it has been approved under test by the Chief Sanitary Inspector. One of each of the above type of gaskets, flanges and iron bends shall be kept on exhibition in the Sanitary Department.

**1713. Slip joints—Ground joints.** As amended June 18, 1906: Slip joints shall not be permitted on the sewer side of any trap, unless the metal connection is required between the soil or waste pipe and tile sewers. Unions on wrought iron, soil, waste and vent pipes shall be made by means of metallic brass-seated ground unions, or flange unions with sheet lead gaskets, and made without other gaskets or packing.

**1714. Barn drainage—traps—catchbasins.** Floor washouts, urinal gutters and wash racks in barns or stables shall be provided with deep seal traps, having heavy strainers. Such traps shall have a depth of seal of at least three inches and shall be located at the floor line. An adequate water supply shall be provided for flushing such gutters.

All liquid wastes from barns or stables shall be intercepted before entering the sewer by a catchbasin placed outside of the building, which shall be either the catchbasin which is constructed according to the specifications for such catchbasins or a cast iron catchbasin provided with bolted air-tight iron cover. Barn drains and wastes shall be ventilated by sufficient and proper vents through the roof.

**1715. Special permits—when issued.** Special permits will be issued by the chief sanitary inspector only.

Where special permits are issued the location shall be inspected before the work is started and duplicate plans in ink, in the name of the owner, agent or architect, shall be submitted and approved and placed on file. These plans shall show the proposed work, in plan and elevation. Such plans shall be drawn on paper or cloth and drawn to a quarter inch to the foot scale.

The installation of any sewer connected fixture or of any sewer connected pipe or pipes other than those hereinbefore mentioned, or under any other conditions than those hereinbefore set forth, shall be as directed by the chief sanitary inspector and the same shall be covered by special permits issued by him.

**1716. Plumbers' notification—inspection, when.** When the plumbing in any building is ready for inspection the plumber in charge of the work shall immediately notify the commissioner of health in writing of such fact at least twenty-four hours in advance of inspection. Inspections will not be made the same day that notifications are received.

**1717. Inspection of repairs.** As amended June 18, 1906: The following repairs and extensions to any part of the plumbing and drainage system in any building, shall also be reported for inspection, viz., where there is any change in any sewer connected pipe, and where such change is on the sewer side of the trap, except in the case of minor repairs.

**1718. Inspections—tests.** (As amended March 12, 1906.) The entire plumbing system when roughed in, in any building, shall be tested by the plumber in the presence of the plumbing inspector and as directed by him, under either a water pressure or air pressure.

The water pressure test for plumbing shall be applied by closing the lower end of the vertical pipes and filling the pipes to the highest opening above the roof with water. The air pressure test for plumbing shall be applied with a force pump and mercury column equal to ten inches of mercury. The use of spring gauges is prohibited. Special provision shall be made to include all joints and connections to the finished line or face of floors or side walls, so that all vents or revents, including lead work, may be tested with the main stacks. All pipes shall remain uncovered in every part until they have successfully passed the test. After the completion of the work, and when fixtures are installed, either a smoke test under a pressure of one inch water column shall be made of the system, including all vent and revent pipes, in the presence of the plumbing inspector and as directed by him, or a peppermint test made by using five fluid ounces of oil of peppermint for each line up to five stories and basement in height, and for each additional five stories or fraction thereof one additional ounce of peppermint shall be provided for each line.

All defective pipes and fittings or fixtures shall be removed and all defective work shall be made good so as to conform to the provisions of this chapter.

The tile drainage system inside any building shall be tested by the drainage layer or sewer builder, in the presence of the house drain inspector, by closing up the end of the drains two (2) feet outside the building and filling the pipes inside the building with water to a height at least two (2) feet above the highest point of the tile drainage system.

All defective pipes and fittings or fixtures shall be removed and all defective work shall be made good and so as to conform to the provisions of this chapter.

**1719. Water closet and urinal compartment—ventilation.** Water closets and urinals shall not be installed in an unventilated room or compartment. In every case the room or compartment shall be open to the outer air or be ventilated by means of an air duct or shaft or be mechanically ventilated.

In the case of an extension or alteration of any existing plumbing system, the same, if new stacks are run, shall be tested when roughed in and when completed as hereinbefore provided.

**1720. Peppermint test for alterations.** In other alteration work a peppermint test and only this test shall be applied by using five fluid ounces of oil of peppermint for each line up to five stories and basement in height, and for each additional five stories or fraction thereof one additional ounce of peppermint shall be provided for each line.

**1721. Old work remodeled.** In remodeling work the existing system of soil, waste and ventilating pipes shall be changed to make them reasonably conform to the provisions of this chapter.

Where a urinal, bath, or water closet compartment is mechanically ventilated the air shall be changed at least four times per hour by exhausting the air from the compartment.

**1722. Light and ventilation.** All urinals, bath, or water closet compartments hereafter constructed in any building shall be lighted and ventilated as hereinafter provided for. Every water closet or urinal compartment or bath room in every now existing building and every compartment in buildings hereafter erected, where the compartment is more than one story under ground, shall be separately ventilated by a window opening to the external air or by proper and adequate ventilating pipes, shafts, or ducts running through the roof, or to the external air, and providing for at least four changes of air for the entire compartment each hour. All such compartments shall be adequately lighted by either natural or artificial light.

**1723. Toilet compartments—separate.** The urinal, bath, or water closet compartments shall be separate compartments and shall be entirely separated from any other room, workshop, office, or hall, by a tight partition extending from floor to ceiling, and every door of every such compartment shall be provided with a door check to keep such door closed.

No window or other opening shall be made to open from any such compartment for the purpose of ventilation, into any adjoining room, office, workshop, factory, hallway, or compartment of any kind.

**1724. Window area in toilet compartments.** In every building hereafter constructed every such compartment, where there is not more than one story under ground, shall have a window not less than one foot wide and of an area of at least four square feet for a floor area of forty-five square feet or less, opening directly into the outer air or special light and air shaft, into which no other rooms or compartments, other than toilet compartments, are ventilated. For upwards of forty-five square feet of floor area there shall be a window area of at least one-tenth of the floor area. The windows in all cases are to be arranged so as to admit their being opened at least one-half their height. The urinal, bath, or water closet compartments on the top floor of any building may be lighted and ventilated by means of a skylight and ventilator. The area of the skylight shall conform to the above specified areas for windows.

**1725. Keep clean.** All such fixtures in such compartments as are referred to in the previous section shall be kept in a thoroughly clean and sanitary condition.

**1726. Ventilation into court.** Nothing herein contained shall be construed as preventing the ventilation of the above mentioned compartments into an outer, inner, or lot line court.

**1727. Plans—plan and elevation, etc.** Building plans in duplicate shall be filed with the bureau of sanitary inspection before the original plans are approved. Such duplicates shall be on paper or cloth and drawn to a standard scale, showing how all rooms and compartments of the building are to be lighted and ventilated. They shall also show in plans and in at least one elevation all drains, soil, waste, vent, and revent pipes within the building and the location of all plumbing fixtures within the building, the location of the catchbasin (in case one is necessary) outside of the building, and its connection to the drainage and sewerage system.

**1728. Fee before plans are approved.** As amended June 18, 1906: Before plans are approved the following fees for inspection shall be paid to the City Collector:

When the building contains from one to six plumbing fixtures, the sum of fifty cents shall be paid for the inspection of each fixture, and for each and every additional fixture thereafter installed, or for which waste or vent fittings are installed, the sum of twenty-five cents shall be the fee for inspection.

**1729. Certificate of inspection.** When the plumbing in a building is completed the plumber or his representative shall secure for the owner of such building from the commissioner of health a certificate of inspection, signed by the chief sanitary inspector and approved by the commissioner of health, certifying that the plumbing work has been properly inspected and tested as required by the provisions of this chapter.

**1730. Penalty.** Any person or corporation who shall violate any of the provisions of this chapter shall be fined not more than two hundred dollars nor less than twenty-five dollars for each offense; and each day on which such violation shall be allowed or suffered to continue shall constitute a separate and distinct offense.

# SIDEWALKS AND VAULT COVERING.

## SYNOPSIS OF SPECIFICATIONS FOR CONCRETE AND STONE SIDEWALKS, AND FOR WALKS LAID OVER VAULTS, ETC., FROM ORDINANCE PASSED MARCH 23, 1904.

Requirements of the City as to quality of work, etc., must be observed under penalty.  
Walks Laid on Filling.

Prepare foundation by cutting down or filling up to a sub-grade 14 inches below final sidewalk grade. Where filling is necessary it shall be of earth or cinders, or other material equally good, free from animal or vegetable matter, placed to leave a berme of one foot on each side of and flush with the top of the completed walk (except where the walks are laid full width of the sidewalk space), and shall slope to the natural surface  $1\frac{1}{2}$  feet horizontal to 1 foot vertical. Where necessary the foundation must be compacted until solid. Soft places must be dug out and refilled and thoroughly compacted. Upon this sub-foundation lay cinders, 9 inches in depth after being flooded and thoroughly tamped. Upon this foundation place a layer of hydraulic cement concrete  $4\frac{1}{4}$  inches thick, composed as follows:

### Concrete Mixed with Sand.

One part of cement equal in quality to the best Portland,  $2\frac{1}{2}$  parts of clean torpedo sand, ranging from  $\frac{1}{8}$  inch down to the finest, and 5 parts of crushed limestone, or other stone equally as good, or washed gravel, all free from dust and dirt or other foreign substances, and not less than  $\frac{1}{4}$  inch or more than 1 inch in any dimension. The cement and sand shall be thoroughly mixed dry, after which it shall be moistened with water and made into a stiff mortar. The crushed stone or gravel to be sprinkled with water, then incorporated in the mortar and the mass thoroughly mixed by turning over with shovels, hoes, or mixers at least three times, and then placed on the foundation and rammed until solid.

The finishing layer,  $\frac{3}{4}$  of an inch thick, 2 parts of cement equal in quality to the best Portland and 3 parts clean torpedo gravel or granite screenings put on before the first layer has set, and troweled to give the walk a smooth, even and glossy surface.

**Space at Curb:** A space of  $1\frac{1}{2}$  inches between all walks and the curb at street and alley intersections.

All mixing to be done on water-tight platforms.

All work on 5, 6, 10, 12, 15, 18, 20, 24 and 25 foot walks to be laid out in blocks 5 feet by 6 feet in size; on all other widths the stones to be uniform and to have a surface of not less than 24 square feet nor more than 36 square feet.

All walks to be laid on a line 1 foot from and parallel with the lot line unless ordered by special ordinance.

## WALKS LAID OVER VAULTS, ETC.

### Beam Work.

**Substructure:** Steel I beams set not more than 5 feet centers, the outer end to rest 8 inches on curb wall and be firmly bedded in masonry to the top flange. Where practicable the inner end of beam to penetrate the building wall 6 inches. Whenever beams rest on an area wall, and the clear span between bearing points exceeds 9 feet, wall must not be less than 12 inches thick.

Where no area or building wall exists cross beams shall rest on or be framed into a girder beam and fastened to same with proper angles and thoroughly bolted or riveted. All intersecting or girder beams to be 1 inch deeper than the cross beams, which are to rest on or be framed into them.

Said girder beams to be supported by circular cast iron columns, not more than  $8\frac{1}{2}$  feet apart from centers, and not less than 5 inches external diameter and metal not less than  $\frac{1}{2}$  inch thick, free from blow-holes and defects.

Columns to rest on 12 by 12 inch iron plates 1 inch thick, firmly bedded in a concrete foundation not less than 18 inches thick and having a surface bearing not less than 4 square feet. The top of column shall have a square plate 1 inch thick, fitted

CHICAGO "AA" PORTLAND CEMENT.

WE MAKE ONE BRAND ONLY,  
THE BEST THAT CAN BE MADE.

53,330 Bbls. used in Thebes Bridge.

6,500 " " " Kankakee Reinforced Concrete Bridge  
1,050 " " " Kenosha " "

Hennepin Canal, Government Post Offices, Principal Railroads  
and Contractors in the Northwest our patrons.

with a shoe formed in same, in which the girder beam shall rest. Columns over 10 feet to be  $\frac{3}{4}$  inch metal, and 6 inches external diameter.

The top of the completed iron substructure shall be parallel with and 4 inches below top of finished walk.

The following sized steel cross beams shall be used:

Span in Feet.	Beams Deep in Inches.	Weight per Ft., lbs.
6 and 7	6	12 $\frac{1}{4}$
8	7	15
9 and 10	8	17 $\frac{3}{4}$
11 and 12	9	21 to 25
13	10	25
14, 15 and 16	12	31 $\frac{1}{2}$
17 and 18	12	40
19 and 20	15	42

If necessary to change spacing between beams or use a beam of different depth than specified, the spacing shall be so changed, or such beam shall be of sufficient weight to give it bearing strength equal to the beam specified.

**Concreting:** Between the beams set in place and securely fastened to the lower flange, shall be placed temporary centers, smooth on the upper surface, which shall be removed when the concrete is set, the top or crown of same shall be two inches below the top of the steel cross beams.

Upon the above forms shall be placed the concrete, composed of the same kind of material, in the same proportions, etc., as the concrete specified for sidewalks, especial care being given to tamping and ramming, and brought to a grade three inches above the top of the steel substructure and 1 inch below and parallel with the top of the completed walk. The finishing layer, 1 inch thick, composed of two parts of cement, equal in quality to the best Portland, and 3 parts screened torpedo gravel, or granite screenings, to be put on before the first layer has set, and troweled sufficiently to give the walk a smooth, even and glossy surface, joints to be formed over the center of each I beam in the concrete as well as in the top dressing, and extend over the curbing down to the pavement.

Any system or method of vault construction equal to the above system may be used in lieu thereof, but in all cases any plans calling for beams or a construction of a size or character different from the above sizes and weights must be submitted to the Commissioner of Public Works for approval before construction is commenced and must be capable of sustaining a distributed safe load of 300 pounds per square foot, including weight of walk.

A stamp or plate giving the name and address of the contractor or person building the walk and the year in which the work was done. The top of said plate or stamp must not cover more than 54 square inches of surface, shall be flush and even with the top of the finished walk and must be of a permanent character.

Wherever one contractor or person has laid walks in front of three or more adjoining lots in one stretch, one of the stamps placed at each end of stretch of walk will be sufficient.

**Slope:** All sidewalks to be so constructed that the grade shall be a uniform incline, with a fall of 1 inch in every 3 feet.

**Curbage:** The curbage shall have a top dressing 1 inch thick, and shall extend 4 inches below the top of the pavement. When finished it shall present a true and perfectly plumb appearance; all joints to be straight and clean cut.

**Driveways** shall conform to the sidewalk grade and shall be 9 inches in depth, consisting of a layer of concrete 7 inches in depth and a finishing layer of 2 inches. Work to be as specified for Portland concrete walks.

**Stone Sidewalks** shall be constructed of the best quality of limestone, quarried a sufficient time to be seasoned and thoroughly frost proof. Stone to be free from cracks, etc., sawed or planed, with full joints grooved for  $1\frac{1}{4} \times \frac{3}{8}$  inch iron bars, the ends to be full and heads dressed to a uniform thickness. No stone to be less than  $4\frac{1}{2}$  feet wide and of the following thicknesses:

For walks 8 feet wide the stone shall be not less than 6 inches thick.

For walks 10 feet wide the stone shall be not less than 8 inches thick.

For walks 12 feet wide the stone shall be not less than 10 inches thick.

For walks 14 feet wide the stone shall be not less than 12 inches thick.

For walks 16 feet wide the stone shall be not less than 14 inches thick.

Stones to be bedded on the curb wall on the outside and inside on 6x8 inch iron lintels of  $1\frac{1}{4}$  inch metal, supported by circular cast iron columns not less than 8 feet in length set not more than 8 feet apart from centers; on foundation of stone

not less than 12 inches deep, and having a surface bearing of not less than 4 square feet. Columns to be of the best quality of cast iron, free from all defects, of the following sizes external diameter:

For walks 8 feet wide or less 4 inch columns of  $\frac{1}{2}$  inch metal.

For walks 10 feet wide or less 5 inch columns of  $\frac{1}{2}$  inch metal.

For walks 12 feet and over 6 inch columns of  $\frac{1}{2}$  inch metal.

Columns over 10 feet in length shall be of  $\frac{3}{4}$  inch metal and 1 inch greater in external diameter than the sizes specified above.

All joints in the walk to be made water tight by caulking with oakum and pitch.

**Slope:** All sidewalks to be so constructed that the top surface shall coincide with the grade of the space between the curb line and the street line, which grade shall be a uniform incline from the street line toward the curb line, with a fall of 1 inch in every 3 feet.

---

## BOILER (STEAM) AND SMOKE INSPECTION DEPARTMENT.

---

According to the Municipal Code, with code number and amendments to date.

**Section 2204—Department Established—Chief Inspector:** There is hereby established a department for the inspection of steam boilers and steam plants, the head of which shall be known as the Chief Inspector of Steam Boilers and Steam Plants.

**Sec. 2205—Appointment:** He shall be appointed by the Mayor by and with the advice and consent of the City Council.

**Sec. 2206—Qualification:** The person so appointed shall be well qualified from practical experience in the design or construction and operation of boilers, generators, and superheaters, and their appurtenances, used for generating steam for power, steaming or heating purposes, to enable him to judge of their safety for use as such. No person employed in the department created by this chapter shall be directly or indirectly interested in the manufacture, ownership, or agency of steam boilers or other apparatus or appliances used in the generation or use of steam, which are to be inspected.

**Sec. 2207—Bond:** The Chief Inspector of Steam Boilers and Steam Plants, before entering upon the duties of his office, shall execute a bond to the City of Chicago in the sum of five thousand dollars (\$5,000) with sureties to be approved by the Mayor, conditioned for the faithful performance of the duties of his office.

**Sec. 2208—Supervising Mechanical Engineer:** There is hereby created the office of Supervising Mechanical Engineer and Chief Deputy Inspector of Steam Boilers and Steam Plants. He shall be appointed by the Chief Inspector of Steam Boilers and Steam Plants according to law.

**Sec. 2209—Bond:** The Supervising Mechanical Engineer and Chief Deputy Inspector of Steam Boilers and Steam Plants, before entering upon the duties of his office, shall execute a bond to the City of Chicago in the sum of five thousand dollars (\$5,000), with sureties to be approved by the Comptroller, conditioned for the faithful performance of the duties of his office.

**Sec. 2210—Chief Smoke Inspector:** There shall be a Chief Smoke Inspector, who shall be appointed by the Chief Inspector of Steam Boilers and Steam Plants according to law.

Said Chief Smoke Inspector, before entering upon the duties of his office, shall execute a bond to the City of Chicago in the sum of five thousand dollars (\$5,000), with sureties to be approved by the Comptroller, conditioned for the faithful performance of the duties of his office.

**Sec. 2211—Board of Inspectors of Steam Boilers and Steam Plants—to Inspect City and Board of Education Boilers.** (As amended February 5th, 1906): The Chief Inspector of Steam Boilers and Steam Plants, the Supervising Mechanical Engineer and Deputy Inspector of Steam Boilers and Steam Plants, and the Chief Smoke Inspector shall constitute the Board of Inspectors of Steam Boilers and Steam Plants. The Chief Inspector of Steam Boilers and Steam Plants shall be chairman of said board, and the Supervising Mechanical Engineer and Chief Deputy Inspector of Steam Boilers and Steam Plants shall be secretary of said board. Any two members of said board shall constitute a quorum. Said board shall have the same power over all steam boilers and steam plants owned or operated by the city, or the board of education, as over all other steam boilers and steam plants in said city; and all steam boilers

and steam plants owned, operated, or controlled by the city or by the board of education of said city, shall be subject to the requirements of this chapter; and it shall be the duty of said Board of Inspectors of Steam Boilers and Steam Plants to inspect at least once in each year all of such steam boilers and steam plants as are owned, operated or controlled by the city, or by said board of education, and also to preserve a record of the condition of such steam boilers or steam plants as shown by such inspection. No fee shall be charged or paid to said department nor to any employee under said department, for the inspection of any steam boiler or steam plant or for the certificate of inspection issued by said department for any steam boiler or steam plant owned, operated, or controlled by said city.

**Sec. 2212—Duties of the Board:** It shall be the duty of the Board to inspect all boilers, tanks, jacket kettles, generators or other apparatus used for generating or transmitting steam for power, or using steam under pressure for heating or steaming purposes, and all other tanks, jacket kettles and reservoirs under pressure of whatsoever kind, except as hereinafter provided, as often as once in each and every year, by making a hydrostatic pressure test where such tests shall be deemed necessary; provided, that the hydrostatic pressure used in such test shall not exceed the maximum working pressure of said apparatus by more than fifty per cent; and by making a careful external and internal examination. In all cases where hydrostatic pressure test is used an internal examination of said apparatus shall afterwards be made. In certifying the working pressure allowed on each steam boiler, steam generator or other apparatus the same shall be determined by multiplying one-fifth of the lowest tensile strength of any plate in the cylindrical shell of said steam boiler or steam generator or other apparatus by the lowest efficiency of joint in such cylindrical shell expressed in decimals, and by multiplying the product by the thickness, expressed in inches or parts of an inch, of the thinnest plate in the same cylindrical shell and divide by the radius, also expressed in inches. This sum will be the pressure allowable per square inch of surface.

Any boiler, tank, jacket kettle, generator or reservoir having been in use eight years or more and its condition being such that in the opinion of the inspector the same should be drilled in order that the exact thickness and condition may be ascertained, he shall report the same to the Chief Inspector of Steam Boilers, who shall serve the owner or agent with a written notice to show cause to the Chief Inspector within five days why such boiler, tank, jacket kettle, generator or reservoir should not be drilled.

If, after the owner or agent has been heard, or at the end of five days, the Chief Inspector deems it necessary that the boiler, tank, jacket kettle, generator or reservoir be drilled, then the boiler, tank, jacket kettle, generator or reservoir may be drilled at points near the water line, and at the bottom of shell of boiler, or such other points in the boiler, tank, jacket kettle, generator or reservoir as the inspecting officer may direct, and the thickness of said material shall be determined thereafter at such annual inspection as the inspecting officer may deem necessary, and the steam pressure or other pressure allowed shall be governed by such ascertained thickness and general condition of boiler, jacket kettle, generator or reservoir. And the drilling and plugging of said holes shall be done at the expense of the owner.

Any boiler may be tested and rated in accordance with the United States Marine Inspection Law governing the inspection of steam boilers. But no boiler, tank, jacket kettle or jacket constructed or re-constructed of boiler plates hereafter, where the same are required, shall have stay bolts of less than seven-eighths of an inch in diameter and pitched more than seven inches apart. And all stationary boilers, tanks, jacket kettles or jackets carrying a pressure of one hundred pounds or over to the square inch, the construction of which requires stay bolts shall be equipped with hollow stay bolts. All boiler heads made of boiler plate shall be braced with braces, the sectional area of which shall not be less than one square inch each, so pitched that a greater strain than six thousand pounds per square inch of section shall not be carried by any one brace or stay bolt. In computing the strain on braces in flat surfaces the diameter of brace rivets shall be considered. In computing the strain on shells having dished heads the pressure will be figured according to the radius of the heads.

It shall be the duty of the board to see that the boiler or boilers, boiler-setting, means of producing draft, smoke connections and furnace or firebox of each boiler inspected by it are of sufficient capacity and so constructed as with proper management to avoid the issuance or emission of dense smoke from any chimney or smoke-stack connected therewith.

**Sec. 2213—Emission of Dense. Smoke Prohibited.** (As amended January 2, 1906): The emission of dense smoke within the city from the smokestack of any locomotive, steam boat, steam tug, steam roller, steam derrick, steam pile driver, tar kettle or other similar machine or contrivance, or from the

smokestack or chimney of any building or premises, excepting for a period of six minutes in any one hour during which the firebox is being cleaned out or a new fire being built therein, is hereby declared to be a nuisance and may be summarily abated by the Chief Smoke Inspector, or by anyone whom he may duly authorize for such purpose. Such abatement may be in addition to the fine hereinafter provided. Any person or persons, or corporation, owning, operating, or in charge or control of any locomotive, steam boat, steam tug, steam roller, steam derrick, steam pile driver, tar kettle, or other similar machine or contrivance, or of any building or premises, who shall cause or permit the emission of dense smoke, within the city, from the smokestack, or chimney of any such locomotive, steam boat, steam tug, steam roller, steam derrick, steam pile driver, tar kettle or other similar machine or contrivance, or from the smokestack or chimney of any building or premises so owned, controlled or in charge of him, her or them, except for a period of six minutes in any one hour during which the firebox is being cleaned out or a new fire being built therein, shall be deemed guilty of a violation of this ordinance, and upon conviction thereof shall be fined not less than ten dollars nor more than one hundred dollars for each offense; and each day of such emission of dense smoke shall constitute a separate offense.

Sec. 2214—Repealed by City Council January 22, 1906.

Sec. 2215—**Prosecutions for Violations—by Whom to Be Instituted.** (As amended January 2, 1906): Provides that prosecutions for all violations of above section shall be instituted by the Chief Smoke Inspector, in the name of the City of Chicago.

Sec. 2216—**Permit for New Plants, Plans, Etc.:** No new plants, nor any reconstruction of any old plants, for producing power and heat, or either of them, nor any new chimney connected with a steam plant, shall be erected or maintained in the City of Chicago until the plans and specifications of the same have been filed in the office of and approved by the Board of Inspectors of Steam Boilers or Steam Plants, which plans and specifications shall show the amount of work and the amount of heating to be done by such plant and all the appurtenances thereto, including provisions for the complete combustion of the fuel to be used and for the prevention of smoke, and a statement of the kind of fuel proposed to be used. Such plans and specifications shall also show that the room or apartment in which such plant shall be located is provided with doors, windows, air-shaft, fans and other means of ventilation sufficient to prevent the temperature of such room, apartment, basement, or other portion of such building wherein said steam plant or apparatus is to be used, from rising to a point higher than one hundred and twenty (120) degrees Fahrenheit, or that the atmosphere of any such apartment wherein such apparatus may be located may be entirely renewed every ten minutes. Upon approval of said plans and specifications, a duplicate set of which shall be left on file in said office, and the payment of fees as hereinafter provided, said Board shall issue a permit for the installation of such plant or such reconstruction. Such permit shall state the maximum amount of steam pressure to be carried. As soon as the Board hereby created has examined the plans and specifications submitted for a new steam plant in a new building and has issued a permit for the installation of same, it shall notify the Commissioner of Buildings to see that the execution of the construction work on the building in which such plant is to be installed is carried out in conformity with the plans and specifications of the proposed steam plant for the execution of which a permit has been issued, with special reference to the amount of space to be used for such appurtenances, the size and construction of the chimney or chimneys to be used, and the provisions for ventilation and proper temperature in the engine and boiler rooms.

It shall be the duty of the Supervising Mechanical Engineer and Chief Deputy Inspector of Steam Boilers and Steam Plants to examine in detail all plans and specifications that may be submitted to the Board, and to report upon the same for approval by the Board. All permits shall be issued by an affirmative vote of a majority of the Board.

Sec. 2217—**Duty of Owners:** It shall be unlawful for any person to use any steam boiler or any tank or tanks subject to pressure other than City pressure, until he shall have first procured a certificate from said Board that said apparatus may be safely used, and that the boiler or boilers, boiler setting, means of producing draft, smoke connections, and furnace or fire-box are of such size and capacity that they will do the work required, and be capable of being so managed for the purpose of generating steam that no dense smoke shall be emitted from the chimney connected with such furnace or fire-box.

If such owner, agent or person using a steam boiler or tank shall fail to notify said Board of his intention to make any alteration, repairs or enlargement of such steam plant, and shall fail to file plans and specifications for the enlargement or alterations of the same, and shall proceed to make such alterations, repairs or enlargement without a permit therefor, he shall be liable to a fine of twenty-five dollars

(\$25.00) for each day on which he shall have prosecuted such alteration, repairs or enlargement without said permit, and each day's violation shall constitute a separate offense. Provided, however, that minor necessary or emergency repairs which do not increase the capacity of said apparatus or involve any substantial alteration of structure may be made by or under the engineer in charge of said apparatus without permit or report thereof.

If at any time when inspecting a steam boiler, generator or other apparatus used for generating steam for power or heating purposes the Inspector of Boilers shall find that the furnace or fire-box in which fuel is used for the purpose of generating steam is so constructed or operated as to cause the emission of dense smoke from the chimney connected therewith he shall report to said Board the condition of said plant. The owner of said steam boiler, generator or apparatus shall have the right to put in such appliance or make such alterations or use such fuel as in his judgment will prevent the emission of dense smoke, but this shall not constitute a compliance with this chapter unless such appliance or such fuel shall actually prevent the emission of dense smoke.

Provided that any boilers for heating purposes only, in which the permit specifies that not more than ten pounds of steam pressure to the square inch shall be carried, shall be known as "low pressure boilers."

After the next inspection of such low pressure boilers shall have been made following the adoption of this ordinance, inspections thereafter shall be made once in every three years. But all of such low-pressure plants may be inspected at any time thereafter, and without charge, with reference to the provisions for draft, complete combustion or degree of combustion of fuel and prevention of the emission of smoke.

**Sec. 2218—Exceptions:** The provisions of this chapter relating to the inspection of boilers, generators or other apparatus carrying other than city pressure shall not apply to such boilers, generators or apparatus while in use or installed in any locomotive, steam or tug boat. The provisions of this chapter relating to the inspection of steam boilers, generators or other apparatus carrying other than city pressure shall be held to apply to any such steam boiler, generator or apparatus in use or installed in any steam roller, steam derrick, steam pile driver, automobile or other movable structure or contrivance of any kind whatsoever used within the city. Provided, however, that this ordinance shall not apply to boilers, generators or other apparatus used in private residences for generating steam solely for heating purposes; and for the purpose of this ordinance flat buildings or apartment buildings with more than three apartments shall not be classed as private residences, and any steam boiler, generator or other apparatus used for generating steam in flat buildings or apartment buildings having more than three flats or apartments shall be subject to inspection as hereinbefore provided.

**Sec. 2219—Certificate—Record:** When an inspection of a boiler or boilers, tank or tanks, jacket-kettle, generator or generators, superheater or superheaters, or any apparatus under pressure, has been made, and the same shall be approved by the Chief Inspector or Supervising Mechanical Engineer and Chief Deputy Inspector of Steam Boilers and Steam Plants, he shall make and deliver to the person for whom the inspection was made, upon the payment of the fees hereinafter mentioned, a certificate of such inspection, which shall contain the date of inspection, together with a general description, for what purpose used, the number of try-cocks, steam and water gauges, the pounds pressure at which they may be safely used; which certificate shall be framed and put up in a conspicuous place in the engine or boiler room, and a record of the same shall be made and kept by said Board, in a well-bound book or books, indexed alphabetically or by locality.

**Sec. 2220—Certificate of Inspection—Permit for New Plant, Etc.—Issuance or Possession not to Exempt from Prosecution for Emission of Dense Smoke.** The issuance or delivery by the board to any person or corporation of any certificate of inspection herein provided for, or the possession by any person or corporation of any such certificate, shall not be held to exempt any person or corporation to whom such certificate was issued or delivered, or who is in possession or control of any such certificate, from prosecution for any violation of the provisions of this chapter in relation to or concerning the issuing or emission of dense smoke caused or permitted by any such person or corporation. The issuance or delivery by said board of any permit for the construction of any new plant or the reconstruction of any old plan or any part thereof, or for the construction or reconstruction of any chimney connected with any steam plant, shall not be held to exempt any person or corporation to whom any such permit has been issued or delivered, or who is in possession of any such permit, from prosecution on account of the emission or issuance of dense smoke caused or permitted by any such person or corporation.

**Sec. 2221—Inspection of Repairs:** It shall be the duty of said Inspector, upon an application in writing made by any person, firm, corporation, or agent, owning, leasing or controlling the use of any boiler, tank, jacket-kettle, generator, or superheater, stating that the same is out of repair or has been repaired, to examine the same when so repaired, and determine if such repairing has been properly done; and it shall be unlawful for any person, firm, corporation, or agent to use any boiler, tank, jacket-kettle, generator, or superheater, after the same has been repaired, until a certificate shall have been procured from the Inspector to the effect that such repairing has been properly done, and such boiler, tank, jacket-kettle, generator, or superheater may be safely used, except as hereinbefore provided in this chapter.

**Sec. 2222—Fees:** The fees for inspection of steam boilers and other apparatus under this chapter shall be as follows:

Class A. Including steam boilers, tanks, jacket-kettles, of a capacity of seventy-five gallons or over, generators, or other apparatus under a pressure exceeding ten pounds per square inch in plants where only one such apparatus is used, five dollars each.

Class B. Steam boilers, generators, or superheaters under pressure exceeding ten pounds per square inch in plants where more than one such is used, five dollars for the first and three dollars for each additional apparatus.

Class C. Tanks and jacket-kettles, of a capacity of seventy-five gallons or over, under pressure in plants where more than one such tank or jacket-kettle is used, one dollar each for all after the first.

Class D. All low-pressure steam boilers as herein described in this chapter, three dollars each.

Class E. The fee for a permit for a new steam plant or for additions to an old plant shall be five dollars for each boiler or tank to be used under pressure or for the addition or rebuilding of any smokestack or chimney or for any material alteration or change made in such plant. The fee for the inspection of steam boilers and other apparatus above provided for shall be double the respective amounts above specified when an inspection is made on Sunday or any legal holiday at the request of the person or corporation owning or operating said steam boilers or other apparatus.

All fees provided for in this chapter shall be paid to the City Collector.

**Sec. 2.** This ordinance shall be in full force and effect from and after its passage.

**Sec. 2223—Exemptions—Charitable, Religious and Educational Institutions:** Said Board may, and it is hereby directed and instructed to, remit all inspection fees charged, or that may hereafter be charged, against any and all charitable, religious, and educational institutions, when the boiler or other apparatus inspected is located in or upon premises used and occupied exclusively by such charitable, religious or educational institution; provided that such charitable, religious, or educational institution is not conducted or carried on for private gain or profit, and provided further, that said Board may require every application for the remission of such fees to be verified by the affidavit of one or more taxpayers of the City of Chicago.

**Sec. 2224—Charging excess fees:** If any person acting on behalf of the city under the provisions of this charter shall take or receive any money or any valuable thing for the purpose of deceiving or defrauding any person or persons, or for the purpose of favoring any person or persons, or if any inspector shall recommend the issue of any certificate of inspection without having at the time stated thoroughly examined and tested the boiler so certified, he shall be fined one hundred dollars (\$100) for each offense.

**Sec. 2225—Try-cocks, Gauges, Force Pumps:** It shall be the duty of every person, or corporation, owning, leasing, or controlling the use of any steam boiler or boilers, subject to inspection, as hereinbefore provided, to provide and properly affix to each and every one of such boilers a full complement of try-cocks, one water gauge, one fusible plug of good Banca tin, one or more pop safety valves (the area of pop valves shall be in the ratio of one square inch to three square feet of grate surface): Provided, that on boilers used for generating steam for heating purposes only and carrying not more than ten (10) pounds steam pressure, direct weighted safety valves may be used. On each steam boiler or steam generator, or other apparatus subject to inspection, there shall be placed a suitable shut-off or main stop valve so placed as to prevent the water passing into the heating apparatus during the test made at the time of inspection; provided that shut-off or main stop valves shall be required only in plants to be hereafter installed, and a good and sufficient force pump or other means of supplying the boiler with water; also a good and sufficient safety valve or reducing valve to all tanks or jacket-kettles, properly attached. No stop or shut-off valve shall be placed between a boiler, tank, or jacket-kettle and the safety valve.

After inspection the Inspector shall seal all safety valves, and said seal shall not be broken except by authority of said Board, except in case of emergency, and when the seal is broken a complete report of the same shall be made to said Board within twenty-four (24) hours; said valve shall be resealed forthwith by said Board without charge, provided the circumstances of the breaking of such seal are approved by said Board.

**Sec. 2226—Owners to Provide Facilities:** Every person owning or having possession or control of any steam boilers, tanks, jacket-kettles, generators, or superheaters, subject to inspection as aforesaid, shall provide at his own expense proper arrangements and facilities for attaching the instruments of inspection. Immediately before the time set for such inspection, every person shall remove all scale, dirt, soot, and sediment in, beneath, and around such boiler, shall fill the same with water, when so directed by the Inspector, and have all main stop valves and other valves and connections on said boiler or boilers perfectly tight, so that the Inspector may be able to apply hydrostatic pressure, leaving all said apparatus in clean condition for inspection.

**Sec. 2227—Engineer's Negligence, Maximum Pressure, and Safety Valves:** Any engineer or other person in charge of a steam boiler or generator who shall negligently or wrongfully endanger the life of any person by permitting the water to fall below three inches above the flues or crown sheet of any boiler, or shall disturb the spring or weight on the safety valve, or break the seal of the safety valve, or tamper with it so as to carry more pressure than allowed by the Inspector, or who shall otherwise neglect his duties, shall be subject to a fine of not less than \$25 nor more than \$100 for each offense and it shall be the duty of the Chief Inspector to report the facts to the Board of Examining Engineers.

The safety valves of steam boilers shall not be loaded to sustain more than the maximum pressure allowed by said Inspector, and the area of the discharge of each safety valve shall be equal to the full area of the valve, and all safety valves shall be directly open to the atmosphere.

**Sec. 2228—Manufacturers and Dealers—Notify Inspectors:** Any person, or corporation manufacturing, dealing in, selling, or erecting steam boilers, tanks, jacket-kettles, or generators, subject to inspection under this chapter, shall, on the sale or delivery of such steam boiler, tank, jacket-kettle, or generator at any point or locality within the city, notify the said Board, giving the name of the owner, name of maker, number and name of street, or otherwise designate the locality of said delivery or sale; shall state also the thickness and quality of the material used in the construction and the brand stamped on the plate.

**Sec. 2229—Second-Hand Dealers:** All steam boiler manufacturers, second-hand steam boiler and junk dealers, and any other person selling second-hand steam boilers, tanks, jacket-kettles, generators, or superheaters, shall before painting the same have them inspected by the Department of Steam Boiler and Steam Plants, and have in their possession a certificate issued by said Department, showing the amount of pressure per square inch the said steam boiler, tank, jacket-kettle, generator or superheater is allowed to carry before offering for sale any second-hand steam boiler, tank, or jacket-kettle, generator, or superheater, and give the buyer the said certificate of inspection. Any person or corporation violating this section shall be fined not less than ten dollars (\$10), nor more than one hundred dollars (\$100), for each offense.

Provided that any person or persons disposing of a second-hand steam boiler, tank, jacket-kettle, generator, or superheater, which has been in use, shall not be required to secure inspection if said steam boiler, tank, jacket-kettle, generator, or superheater is sold to a dealer in or repairer of such apparatus, but such inspection shall be had before such articles are sold for use.

**Sec. 2230—Penalty:** Any person who shall violate any of the provisions of this chapter shall be fined not less than twenty-five dollars (\$25), nor more than one hundred dollars (\$100), for each offense.

**Sec. 2231—Apparatus—Record:** The City of Chicago shall provide such instruments, books, papers and equipment as shall be necessary for the proper performance of the duties of such Board, which shall be the property of said City, and which shall be delivered by said Board to its successors in office. Said Board shall report annually on or before the 1st day of February to the Mayor and City Council, or as often as required by said Council.

Said Board shall prepare and keep in its office a record of each steam boiler, steam generator, tank, jacket-kettle, or other apparatus used for the generation of steam or under pressure other than City pressure, and at the first inspection of any such apparatus under and by virtue of this ordinance a number shall be securely stamped upon the same with a steel stamp or die, of not less than one-half inch in height, in a conspicuous and easily accessible place upon said apparatus, which number shall be

the office number of such piece of apparatus, and the designation by which the same shall be known in said record after such inspection; and said record shall contain a full description of such piece of apparatus, together with the use for which it is employed, the place where it may be located, the name of the owner, agent, or lessee of said apparatus, together with the amount of pressure allowed by the Inspector for the same, and the kind of fuel used, together with the number of try-cocks, steam and water gauges, and any special information pertaining thereto, including a record of inspections made.

**Sec. 2232—Report Defects in Furnaces and Smokestacks:** It shall be the duty of the assistant inspectors to report to said Board defects in furnaces and smokestacks as well as in boilers, and it shall be the special duty of the deputy smoke inspectors to report to said Board dense smoke emitted from chimneys, together with the probable causes therefor, determined by them on investigation of the plants connected with such chimneys.

---

## SPECIFICATIONS FOR STANDARD HOLLOW TILE FIREPROOFING.

**GENERAL.**—The contractor for this work will be required to furnish all the material and labor of every description required to erect the same in place complete. The contractor is referred to the plans and details for the general construction, and especially the steel diagrams and details showing connection between the structural steel and tile work.

**SPECIAL SHAPES.**—The contractor shall furnish all necessary special shapes for the proper fitting to the steel work.

**DETAILS.**—When requested to do so the contractor shall furnish large scale details or full sized drawings for all special shapes, column coverings, lintel covers, girder covers, and general type of arch, which shall be submitted to the architects for their approval.

**SCAFFOLDING, TOOLS, ETC.**—Furnish all the tools, machinery, hoisting apparatus and centering necessary to carry on the work at the rate of progress stipulated in the contract.

**TILE.**—All the tile required for this work shall be of the best quality of hard burned fire clay, semi-porous, or porous terra cotta. This tile to be well manufactured, not badly split, cracked or warped tile will be permitted to go into the work.

**MORTAR AND LAYING.**—All tile work for the floor construction shall be laid in mortar composed of one (1) part American Portland Cement, of approved brand, four (4) parts sharp sand and one part (1) lime mortar, all thoroughly well mixed together as follows: The sand and cement are to be mixed together dry and sufficient water added to thoroughly wet the same, after which the lime mortar is to be added and the whole mass is then to be thoroughly tempered. All other tile work is to be laid in mortar composed as follows: One (1) part Louisville, Rosendale, or other natural cement, three (3) parts sharp sand and one part lime mortar, thoroughly mixed in the manner before described. All tile must be laid with full flush joints, plumb, to a line, with horizontal beds uniformly level on each course. Fill all the joints, chinks and crevices between the tile and steel work with mortar well slushed in.

**TYPE OF ARCH.**—The arches for the floors in general shall be ——— inch; flat or segment arches, with side or end construction. Skewbacks carefully bedded in place against beams.

**BEAM TILE.**—The soffits of all beams to be protected with slabs of tile at least 1 inch in thickness. If more than one inch, the beam tile must be made with air space next to beam.

**ROOFS.**—The arches for the main roof are to be ——— in segment or flat arches same as specified for the floors.

**MINOR ROOFS.**—The roofs of pent houses, roof over projecting portion in second story, floor of bulkheads, and other portions indicated on details as book-tile shall be made of three-inch (3 in.) book-tile set in place between tee-irons. Tee-irons to be furnished by the iron contractor.

**PARTITIONS.**—All partitions shown on the plans to be built the thickness indicated in figures. If no dimensions are given, the following sizes will govern:

Partitions for all corridors and for partitions over 12 feet and up to 14 feet in height to be 4 inches. Partitions over 14 feet in height to be 6 inches, and all cross partitions 12 feet or less to be 3 inches. Partition walls to be built straight, true, plumb and well bonded with proper "breakjoint" bond on each alternate course, and all joints thoroughly flushed up with mortar, and to be well wedged underneath.

**FURRING TILE.**—Where indicated on plans, 2 inch furring tile are to be built against the outside walls of the building. These tiles are to be secured to the brick walls with 10d spikes on every third course, driven into the brickwork at intervals not greater than 48 inches apart.

**CURB WALL.**—The curb wall in basement shall be furred with three-inch (3 in.) tile extending up to the under side of the iron plate along edge of curb wall and properly fitting around all beams.

**ROUGH FRAMES AND BLOCKS.**—The contractor for carpenter work will furnish and erect the rough wood frames at all openings in partitions and furring. He will also furnish all wooden blocks necessary to form nailing facilities for attaching plaster grounds, etc. These blocks must be built in place by fireproofing contractor wherever directed by the architect.

**COLUMN COVERING.**—All column covering shall start, in all cases, directly from the tile arches of floor. Column covering shall be designed to properly fit the columns.

All corners of square columns shall be left square or round. Column covering to be wired on once or twice in each course in height or secured together with clamps.

**COVERING EXPOSED STEEL WORK.**—All girders, beams, channels, etc., that show below the under side of ceilings are to be encased on all sides with at least 1-inch thickness of fire-proof tile secured to the steel in the usual manner. If required, special designs must be submitted to the architect.

**BOXES FOR PLUMBING PIPES.**—All soil, vent, down spout and water supply pipes shall be boxed in, using three-inch (3 in.) tile, starting from the floor tile in all cases. This boxing shall not be done until the pipes have been properly tested, and covered by another contractor. There shall be no openings into boxes except for outlets on the various floors. Where these outlets occur small wood frames furnished by carpenter shall be set by the fireproofing contractor.

**BULKHEADS.**—All bulkheads of first and second floor shall be built of 3-inch tile; the structural iron contractor furnishing all necessary tee-irons for the support of the tile. See details for bulkhead treatment, and iron drawings for the supports.

Provide three-inch (3 in.) tile for the ends of bulkheads where intersected by the entrance doors.

**TOILET ROOM FLOORS.**—All toilet room floors where shown on plans shall be raised approximately one foot with fireproofing. Supports to be so arranged as not to interfere with the piping of these rooms.

**PENT HOUSES.**—The contractor shall build the walls of pent houses with four-inch (4 in.) hard or glazed tile, laid up in Portland cement mortar, all joints to be thoroughly flushed up.

Curbs of all skylights shall be built of four-inch tile.

**FLOOR STRIPS AND CONCRETE FILLING.**—After the floor arches have been set in place, and at such times as may be designated by the architect, the contractor for carpenter's work will furnish and set the 2x3-inch wood floor strips required as nailing ground for the finished wood flooring, where wooden flooring is called for.

After the strips have been set, the fireproofing contractor must fill in between the same with concrete filling; this concrete is to be composed of one (1) part American Portland Cement, of approved brand, two (2) parts sharp sand, and six parts broken tile, stone, gravel or fine, clean coal cinders, thoroughly mixed together dry, then tempered and mixed, and tamped in place. In no case shall cinder concrete be allowed to come in contact with structural steel.

**FINALLY.**—Do everything necessary to finish the entire work in a thorough and substantial manner. Remove promptly from the premises all the tools, scaffolding, unused tile, debris, etc., as soon as the work is completed.

# DEPARTMENT OF ELECTRICITY.

## CITY OF CHICAGO.

### NOTICE.

Particular attention is called to the different sections of the ordinance herein printed: Permit must be obtained before any work is done.

The use of electric current is prohibited previous to certificate being issued.

Conditions unsafe to life or property must be corrected within forty-eight hours.

Each building must have independent service from street or alley.

Wires must not pass through party walls, over roofs or under sidewalks.

Current must not be supplied from trolley lines for motors or light except for power stations owned by company.

Temporary work must be inspected and approved before current is used.

Alterations to existing wiring must not be made without regular permit.

Permits issued by the Commissioner of Public Works for electrical work to be done on streets must be countersigned by the Department of Electricity.

Violation of any of the Sections of this ordinance constitutes a misdemeanor and renders any person, firm or corporation liable to arrest and fine of not less than \$50 or more than \$100, also the cutting off and stopping of current used in violation until the provisions are complied with.

  
City Electrician.

### SPECIAL SUGGESTIONS TO ARCHITECTS.

The Department of Electricity will not allow more than twelve (12) sockets to be attached to one circuit.

Architects are urged to make definite specifications for electrical work, for the benefit of both the electrical contractor and the fixture contractor, specifying the number of outlets in each job for the electrical contractor to follow, and the exact number of 16-candlepower lamps to be used.

Frequently the fixture contractor installs more than twelve lights on a circuit, which is in violation of the city ordinances, and causes the consumer very much annoyance in getting electric current to his premises.

It is also suggested that the architects demand of the electrical contractor that he make up all connections and combinations relative to switches, complicated outlets, etc., leaving only two wires for the fixture hanger to make his fixture connections.

### GENERAL SUGGESTIONS.

In all electric work conductors, however well insulated, should always be treated as bare, to the end that under no conditions, existing or likely to exist, can a grounding or short circuit occur, and so that all leakage from conductor to conductor, or between conductor and ground, may be reduced to the minimum.

In all wiring special attention must be paid to the mechanical execution of the work. Careful and neat running, connecting, soldering, taping of conductors and securing and attaching of fittings, are especially conducive to security and efficiency, and will be strongly insisted on.

In laying out an installation, except for constant-current systems, the work should, if possible, be started from a center of distribution, and the switches and cutouts, controlling and connected with the several branches, be grouped together in a safe and easily accessible place, where they can be readily got at for attention or repairs. The load should be divided as evenly as possible among the branches, and all complicated and unnecessary wiring avoided.

ARCHITECTURAL :: STRUCTURAL

## IRON WORK FIRE ESCAPES AND ELECTRIC CONDUITS

SPECIFY HARVEY-DUCT

HARVEY-DUCT is a rigid, unlined Electric Wire Conduit with clean, perfect and uniform threads; threaded and finished in our own factory; carefully reamed and with smoothly finished couplings.

Our process of treating conduit makes it bend uniform and easy, and does not brittle nor break in bending.

Our rust preventive process and elastic enamel form a hard and finely finished surface, neat and durable.

HARVEY-DUCT is shipped in bundles, being wrapped with canvas to protect the threads and to prevent dirt or stones getting into the conduit.

The use of the wire-ways for rendering concealed wiring permanently accessible is most heartily indorsed and recommended; and this method of accessible concealed construction is advised for general use.

Architects are urged, when drawing plans and specifications, to make provision for the channeling and pocketing of buildings for electric light or power wires, and in specifications for electric gas lighting to require a two-wire circuit, whether the building is to be wired for electric lighting or not, so that no part of the gas fixtures or gas piping be allowed to be used for the gas-lighting circuit.

#### SPECIAL NOTICE.

Place all service switches, meters and cut-outs, when practicable, in basements or public places where they will be readily accessible to inspectors, meter readers and trouble men, in order to obviate the necessity of interfering with tenants of apartments. It often occurs that tenants of apartment buildings who are not using electric current are annoyed by the visits of inspectors and trouble men in their necessary duties in making inspections or repairs for other tenants.

The placing of meters in basements or halls will largely do away with the annoyance caused by their disagreeable humming and it will be much more satisfactory to all concerned.

## SECTIONS OF THE REVISED CODE OF THE CITY OF CHICAGO, GOVERNING ELECTRICAL INSPECTIONS.

March 20, 1905.

### CHAPTER XXV.—DEPARTMENT OF ELECTRICITY.

**807. Electric Current.**—No electric current shall be used for illumination, decoration, power or heating, except as hereinafter provided.

**808. Application—Contents—Permits.**—All persons or corporations desiring to install wires or other apparatus for the use of electric currents for any of the purposes mentioned in the foregoing section shall, before commencing or doing any electrical construction work of any kind whatever, either installing new electrical apparatus or repairing apparatus already in use, file an application for a permit therefor in the office of the City Electrician, which application shall describe in detail such material and apparatus as it is desired to use, with a full description of the same, giving the locality by street and number; and upon receipt of which application, if found proper, such permit shall be given.

**809. Duties of City Electrician Thereon.**—The said City Electrician shall have power, and it shall be his duty, when by him deemed necessary, to carefully inspect any such installation previous to and after its completion, and it shall be competent for him to remove any existing obstructions which may prevent a perfect inspection of the current carrying conductors, such as laths, plastering, boarding or partitions; and if such installation shall prove to have been constructed in accordance with the rules and requirements of the Department of Electricity, controlling the use of electric current, upon the payment of a fee, as herein provided, he shall issue a certificate of such inspection, which shall contain a general description of the installation and the date of such inspection. Any owner installing or causing to be installed any electric wires to be hidden from view shall, prior to such installation, give said city electrician a reasonable notice in order to give ample time for inspection. The use of electric current is hereby declared to be unlawful previous to the issuance of such certificate; provided, however, the City Electrician may issue a temporary permit for the use of electrical current during the course of construction or alteration of buildings, which permit shall expire when the electrical apparatus for such building is fully installed.

**810. Preliminary and Final Certificate.**—A preliminary certificate may be issued by said City Electrician, in the case of completed installations, but upon which no current

# THE KOHLER SYSTEM

**K** We have established a well running and thoroughly reliable system of electrical contracting. This service we call "The Kohler System." We want preference in the best architects' offices; not that we will make the lowest bid on work, but because the architect awarding the work to us will get the best quality of expert service, and the work will be done right the first time

will be used in the immediate future. Such preliminary certificate shall show that at the date of inspection the installation was erected in accordance with the terms of this chapter, and shall be issued at one-half the rates hereinafter named. Prior to the introduction of electric current into the said premises a second inspection shall be made, when, if the said installation is still in accordance with the terms of this chapter, a complete and final certificate shall issue, and the amount of the fee paid for the preliminary certificate shall be deducted from the fee for the final certificate.

**811. Power of City Electrician—Inspections and Re-inspections.**—The said City Electrician is hereby empowered to inspect or re-inspect all overhead, underground and interior wires and apparatus conducting electric current for light, heat or power, and when said conductors or apparatus are found to be unsafe to life or property, he shall notify the person or corporation owning, using or operating them to place the same in a safe and secure condition within forty-eight hours. Any person or corporation failing or refusing to repair, change or remove the same within forty-eight hours, or within such further time as the city electrician shall determine is necessary, after the receipt of such notice, shall be subject to the penalty hereinafter provided.

**812. Poles—Covers—Wires—Electric Service Entrances—Switches.**—All poles now standing or hereafter erected, and all covers for manholes now in service, or hereafter placed in service for the use of electric conductors, shall be branded or stamped with the name of the person or corporation owning the same; all electric service entrances shall have attached to the conductor or conductors, in a conspicuous place, a substantial tag designating the owner, and giving such a full description of the conductors as shall meet with the approval of said City Electrician; and all of said electric service entrances shall be properly equipped with approved cut-out service switches. Each building into which electric current shall hereafter be introduced shall have independent service from the street or alley, entering at right angles with the street curb, except where the service wires are placed in conduits complying with the rules of the department of electricity; and no wires hereafter put up shall pass from one building to another through any party wall or along any building wall or over any roof or under any sidewalk, except where such conduits are used. No electric current shall be supplied from any trolley line for any purpose whatever to any building except for lighting the power stations from which current is supplied to such trolley lines.

**813. Fees.**—There shall be collected by the City Collector, prior to the issuance of certificates permitting the use of electric current, the following fees, in the following manner:

For the inspection of each of the first two arc lamps, one dollar; for each of the next three arc lamps, eighty cents; for each of the next five arc lamps, seventy cents; for each of the next ten arc lamps, sixty cents; for each of the next ten arc lamps, fifty cents; for each additional arc lamp above thirty, twenty-five cents.

Incandescent lamps of nominal 16 candlepower, and for larger or smaller lamps in that proportion, as follows:

For each of the first twenty-five incandescent lamps, ten cents; for each of the next twenty-five lamps, nine cents; for each of the next twenty-five lamps, eight cents; for each of the next twenty-five lamps, seven cents; for each of the next one hundred lamps, six cents; for each of the next one hundred lamps, five cents; for each additional lamp above three hundred, four cents.

For each electrical horse-power of 746 Watts, used for mechanical or other purposes than above mentioned, the sum of one dollar for each horse-power from one to five horse-power, inclusive.

For each of the next succeeding 5 horsepower, seventy-five cents; for each of the next succeeding 5 horsepower, sixty-five cents; for each of the next succeeding 10 horsepower, fifty-five cents; for each of the next succeeding 25 horsepower, fifty cents; for each additional horsepower, twenty-five cents. No inspection shall be made for a less amount than one dollar.

Inspections of temporary installations for show-window exhibitions, conventions and

the like, shall be charged for by the time required for such inspections at the rate of fifty cents per hour.

Each re-inspection of any overhead, underground or interior wires or apparatus, shall be charged for by the time required for such re-inspection at the rate of fifty cents per hour.

ARC LAMPS.

2 arc lamps at \$1, \$2; above 2 lamps to 5.....	at 80 cents each
5 arc lamps, \$4.40; above 5 lamps to 10.....	at 70 cents each
10 arc lamps, \$7.90; above 10 lamps to 20.....	at 60 cents each
20 arc lamps, \$13.90; above 20 lamps to 30.....	at 50 cents each
30 arc lamps, \$18.90; above 30 lamps.....	at 25 cents each

INCANDESCENT LAMPS.

25 lamps, \$2.50; above 20 to 50 lamps.....	at 9 cents each
50 lamps, \$4.75; above 50 to 70 lamps.....	at 8 cents each
75 lamps, \$6.75; above 75 to 100 lamps.....	at 7 cents each
100 lamps, \$8.50; above 100 to 200 lamps.....	at 6 cents each
200 lamps, \$14.50; above 200 to 300 lamps.....	at 5 cents each
300 lamps, \$19.50; above 300.....	at 4 cents each

MOTORS.

5 horse power, \$5; above 5 to 10 horse power.....	at 75 cents
10 horse power, \$8.75; above 10 to 15 horse power.....	at 65 cents
15 horse power, \$12; above 15 to 25 horse power.....	at 55 cents
25 horse power, \$17.50; above 25 to 50 horse power.....	at 50 cents
50 horse power, \$50; above 50.....	at 25 cents

Immediately after the inspection provided for in Section 809 the City Electrician shall make a fee bill, in duplicate, on a form to be approved by the City Comptroller, and shall forward the same to the comptroller to be recorded and rendered. The person or corporation receiving the fee bill shall pay the amount thereof to the city collector, who shall endorse payment thereon, and enter the fee bill to the person or corporation paying the same. The paid fee bill shall then be presented to the city electrician at his office, who shall thereupon issue the preliminary of final certificate, provided for in Section 810.

814. **Alterations.**—No alterations shall be made in any electrical installation without first notifying the said City Electrician and submitting the same for inspection in the same manner as provided for new work.

815. **Penalty.**—Any person or corporation furnishing or using any electric current within the city, in violation of any of the provisions of this chapter, or contrary to any of the rules and regulations of the Department of Electricity, shall be fined not less than fifty dollars nor more than one hundred dollars for each offense, and each day's use thereof contrary to the provisions of this chapter shall constitute and be a separate and distinct offense. Said City Electrician may, for any violation of the provisions of this Chapter, also order and compel the cutting off and stopping of such current until the provisions of this Chapter are fully complied with.

The lower limit is specified for rubber-covered wires to prevent gradual deterioration of high insulations by heat of wires, but not from fear of igniting the insulation. Question of drop is not taken into consideration in above tables.

The carrying capacity of sixteen and eighteen wire is given, but no smaller than fourteen is to be used, except as allowed under Rules 24 *u* and 40 *c*.

## Materials.

The following is a list of non-combustible, non-absorptive, insulating materials for the benefit of those who might consider hard rubber, fiber, wood and the like as fulfilling the requirements.

1. Glass.
2. Marble (filled).
3. Slate without metal veins.
4. Porcelain, thoroughly glazed and vitrified.
5. Pure Sheet Mica.
6. Lava (certain kinds of).
7. Alberene Stone.

## Electric Gas Lighting—

Where electric gas lighting is to be used on the same fixture with the electric light:

No part of the gas piping or fixture shall be in electric connection with the gas lighting circuit.

The wires used with the fixtures must have a non-inflammable insulation, or, where concealed between the pipe and shell of the fixture, the insulation must be such as required for fixture wiring for the electric light.

The whole installation must be test free from "grounds."

The two installations must test perfectly free from connection with each other.

**816. Electric Lighting Facilities—Indemnity.**—The city electrician is authorized to execute and deliver in the name of the city of Chicago to any person or corporation affording facilities for any of the city's electric lighting property, contracts of indemnity to hold such person or corporation harmless from all injuries, damages or expense to any persons or property arising in any way out of the city's exercise of such facilities, when such facilities are not afforded under the requirements of ordinances held by them.

**818. City Electrician in Control.**—The City Electrician shall have charge and control of and shall erect all lamp posts and lamps, and street signs designating the names of the streets which shall be placed on said lamps.

**CHICAGO EDISON COMPANY**

Edison Building      Phone Main 1280      139 Adams Street

# REGULATIONS GOVERNING CHICAGO EDISON COMPANY'S SYSTEM.

## INSPECTION.

All wiring which is to be connected to the mains of this Company must be installed in accordance with the rules and requirements of the Department of Electricity of the City of Chicago and the Chicago Underwriters' Association. A "certificate for installation" or "temporary current permit" from said Department of the City must be presented at the office of the Inspection Department of this Company before current can be used on any wiring for which such certificate or current permit has not been issued. When wiring has been installed for additional lights or power, this certificate or current permit must also be presented as in the case of an original installation. The Company should be notified whenever any additional apparatus is desired to be connected to consumer's wiring in order to avoid interruption of consumer's service and injury to the Company's meters or other apparatus. The Company will make the final connection of all wiring to its mains.

## DIRECT CURRENT TERRITORY.

Current is supplied from the Edison three-wire direct current system in approximately the following territory:

South of Menomonee Street east and north of the Chicago River.

West from the Chicago River to Morgan Street between Kinzie Street and Twenty-second Street, except on Milwaukee Avenue, where the direct current extends to Wood Street; on West Madison, where it extends to Loomis Street, and on Blue Island Avenue, where it extends to Throop Street.

In the "down town" district. On the south side to Thirty-fifth Street between Stewart Avenue and Cottage Grove Avenue.

From Thirty-fifth to Thirty-ninth between Dearborn Street and Grand Boulevard, and on Cottage Grove Avenue from Thirty-fifth to Thirty-eighth Streets.

## ALTERNATING CURRENT TERRITORY.

Current is supplied from the alternating current Edison three-wire system for lighting and small power in all parts of the City, other than those above described, where the Company has lines.

Current is supplied for power from the three-phase system in a large part of the alternating territory, but inquiry should be made of the Inspection Department at the nearest district office as to the proximity of three-phase lines to any particular location where power may be desired.

## SERVICES.—UNDERGROUND.

The consumer's wiring must be extended to the Company's nearest service where sidewalks are excavated and provided with the necessary service switch and cut-outs, unless the premises in which current is to be used are more than 50 feet from the nearest service. In this case, application should be made to the Company to have a service installed.

In case it is necessary to extend service inside of the property line in order to reach the building, the expense of the installation of the portion inside the property line must be borne by the consumer. Final connection of the wiring to the service will be made by this Company in all cases.

## OVERHEAD.

The consumer's wiring must be brought outside the building wall at some point at least 25 feet above the ground, so located that it will be readily accessible to service wires brought from the Company's nearest pole. In case the pole line from which service is to be given is not in position at the time interior wiring is being done inquiry should be made at the district office for information as to its proposed location.

Inside wiring must not be brought out of the building in an inclosed air shaft, as the City ordinance forbids the erection of wires across a roof to reach wires in such a place.

The location of service outlets on a party wall is also forbidden by City ordinances.

## ALTERNATING CURRENT MOTOR AND ARC LAMP.

On the alternating current system, separate services will be provided as follows:

For motors of one horse-power or larger and for arc lamps where a large installation is made.

Inquiry must be made of the Inspection Department in all cases where more than ten alternating arc lamps are being wired, as to whether incandescent and arc lamps may be wired to the same service.

Separate mains and meter loops are of course necessary for all wiring fed by separate services.

### METERS.

Meter loops must be provided in the mains at an accessible point, and so arranged that the meter may be mounted with ordinary wood screws on the wall. A meter board must be provided of sufficient size to allow the installation of a recording watt meter and maximum demand meters. Two demand meters are installed on three-wire mains. Sufficient space must be provided about the meters to allow the removal of the case. Meter loops should not be placed above seven feet from the floor.

In office buildings meter loops should be located at a central point in meter closets or public corridors, and in apartment buildings in the basement of the building, so that meters may be installed and maintained without annoyance to tenants.

### MOTORS.

Wiring for motors should be so arranged that the current used for power purposes may be metered separately from that used for lighting. Wiring for elevators should also be arranged so that current used on elevators may be metered separately from that used for other power.

All motors larger than 1 horsepower must be wound for 220 volts, and it is preferred that motors of three-fourths horsepower and larger be so wound.

Alternating current motors must be designed to operate at a frequency of 60 cycles.

No motors larger than 5 horsepower will be supplied on single-phase system, except by special permission, given by the Inspection Department of the company in each case.

Motors of 5 horsepower and larger will be supplied on the three-phase system at 60 cycles, 220 volts.

No motor will be connected which requires more than three times full load current in starting without load.

### INCANDESCENT LAMPS.

Standard shape Edison base incandescent lamps will be furnished free of charge for installations and renewals, unless otherwise provided for by the terms of the contract, in 4, 8, 10, 16, 24, 32 and 50 candle-power sizes.

One lamp will be furnished for each socket installed in the customer's premises at the time the installation is made. Additional lamps will be furnished at any time when additional sockets have been wired. A reserve supply of lamps, equal to approximately 10 per cent of the customer's total installation, will be advanced for convenience in making renewals. When burned out or blackened, lamps will be renewed free of charge (except special lamps) upon presentation of the old lamps with glass intact at the nearest lamp renewal station.

All lamps furnished for installation, reserve or renewal remain the property of the company. The consumer must, therefore, give his receipt for all lamps delivered to him for installation, reserve or renewal, agreeing to pay for lamps unaccounted for at 20 cents each.

### ARC LAMPS.

Arc lamps having a standard black finish are provided by the company for the consumer's use free of charge. Lamps having ornamental finish will be supplied only at an extra charge.

Lamps furnished by the company will be cleaned and trimmed by the company free of charge when used for general lighting purposes. Arc lamps used for photographing or other purposes than general illumination must be provided and maintained at the consumer's expense. A hanger board must be provided for use in hanging inside lamps and a suitable crane provided with a hook must be provided for outside lamps. They must be installed so that the bottom of the lamp will not be less than eight feet above the ground when it is hung, the length of the lamps being about 40 inches. If it is necessary to install lamps beyond the reach of a six-foot step-ladder, some arrangement must be made for lowering the lamp so that it may be trimmed.

See section on "Services" for special regulations regarding alternating arc lamps.

# GAS FITTERS' RULES.

## OFFICE BUILDINGS, DWELLING HOUSES AND FLATS.

### MANUFACTURED GAS FOR LIGHT.

The following tables show the proportionate size and length of tubing allowed:

Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{3}{8}$ " Openings Allowed.	Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{3}{8}$ " Openings Allowed.
$\frac{3}{8}$ inch	20 feet	2 openings	$1\frac{1}{2}$ inch	150 feet	60 openings
$\frac{1}{2}$ inch	30 feet	3 openings	2 inch	200 feet	100 openings
$\frac{3}{4}$ inch	60 feet	10 openings	$2\frac{1}{2}$ inch	200 feet	200 openings
1 inch	70 feet	15 openings	3 inch	300 feet	300 openings
$1\frac{1}{4}$ inch	100 feet	30 openings			

Drops in double parlors, large rooms and halls of office buildings must not be less than  $\frac{1}{2}$  inch.

## STORES, HOSPITALS, SCHOOLS, FACTORIES, ETC.

### MANUFACTURED GAS FOR LIGHT.

Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{1}{2}$ " Openings Allowed.	Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{1}{2}$ " Openings Allowed.
$\frac{1}{2}$ inch	20 feet	1 opening	$1\frac{1}{4}$ inch	100 feet	20 openings
$\frac{3}{4}$ inch	60 feet	8 openings	$1\frac{1}{2}$ inch	150 feet	35 openings
1 inch	70 feet	12 openings	2 inch	200 feet	50 openings

For stores the running line to be full size to end of last opening.

All drops to be  $\frac{1}{2}$  inch with set not less than 4 inches.

Twenty feet of  $\frac{3}{8}$ -inch pipe allowed only for bracket lights.

### BUILDING SERVICES.

In running service pipe from front wall to meters the following rules will apply:

Size of Opening.	Greatest Length Allowed.	Greatest Number of $\frac{1}{4}$ " Openings Allowed.	Size of Opening.	Greatest Length Allowed.	Greatest Number of $\frac{1}{4}$ " Openings Allowed.
1 inch	70 feet	1 opening	$1\frac{1}{2}$ inch	150 feet	5 openings
$1\frac{1}{4}$ inch	100 feet	3 openings	2 inch	200 feet	8 openings

All openings in service must be equal to the size of riser, which in no case must be less than  $\frac{3}{4}$  inch.

### MANUFACTURED GAS FOR FUEL.

Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{1}{4}$ " Openings Allowed.	Size of Tubing.	Greatest Length Allowed.	Greatest Number of $\frac{1}{4}$ " Openings Allowed.
$\frac{3}{4}$ inch	50 feet	1 $\frac{3}{4}$ -in. or 2 $\frac{1}{2}$ -in.	$1\frac{1}{2}$ inch	150 feet	7 or 4 $\frac{3}{4}$ -in. and 6 $\frac{1}{2}$ -in.
1 inch	70 feet	2 or 1 $\frac{3}{4}$ -in. and 2 $\frac{1}{2}$ -in.	2 inch	200 feet	15 or 8 $\frac{3}{4}$ -in. and 14 $\frac{1}{2}$ -in.
$1\frac{1}{4}$ inch	100 feet	4 or 2 $\frac{3}{4}$ -in. and 4 $\frac{1}{2}$ -in.			

For mantels, grates and small heating appliances, for heating space not to exceed 1,728 cubic feet, thirty feet of  $\frac{1}{2}$ -inch pipe is allowed for one opening only, and two such openings are considered as one  $\frac{3}{4}$ -inch opening.

### FOR GAS ENGINES.

Size of Engine.	Size of Opening.	Greatest Length Allowed.	Size of Engine.	Size of Opening.	Greatest Length Allowed.
1 H. P.	1 inch	60 feet	7 H. P.	$1\frac{1}{2}$ inch	100 feet
2 H. P.	$1\frac{1}{4}$ inch	70 feet	12 H. P.	2 inch	140 feet
5 H. P.	$1\frac{1}{2}$ inch	100 feet			

Supply for gas engine must be separate, and an independent service will be required.

### NATURAL GAS FOR FUEL.

#### Classification of Appliances.

	Size of Openings.	Greatest Length Allowed.
Small portable gas cooking stove.....	$\frac{1}{2}$ inch	20 feet
Small portable gas heating stove.....	$\frac{1}{2}$ inch	20 feet
Kitchen boiler heater when separated from range.....	$\frac{1}{2}$ inch	20 feet

Ordinary coal ranges, equipped for the use of gas.....	$\frac{3}{4}$ inch	30 feet
Large heating stoves .....	$\frac{3}{4}$ inch	30 feet
Gas logs or other grate fires .....	$\frac{3}{4}$ inch	30 feet
Miscellaneous appliances consuming 15 to 40 cubic feet of gas per hour each .....	$\frac{3}{4}$ inch	30 feet
Miscellaneous appliances consuming 40 to 75 cubic feet of gas per hour .....	1 inch	60 feet

For special purposes not provided for above, apply to the company's inspector for information.

### SUMMARY.

1. All branches or cross lines of pipe from the main line must have a set not less than 4 inches dropped square, and must be well secured to joist by gas hooks or straps.
2. All openings must be closed with iron caps, no split pipe or broken fittings repaired with cement or lead will be allowed.
3. All drops on branch lines and openings for side brackets must be square bends; no nipples allowed.
4. The risers in all buildings must be carried up an inside partition out of reach of frost and must be placed where the meter and stop cock can be readily got at. Vestibules not to be considered as inside partitions.
5. To avoid trapping, gasfitters must grade all pipes to riser or drops.
6. In no case will a meter be set where it is not easily accessible, or where it is exposed to frost and dampness, or liable to injury from any cause.
7. All pipe for fuel must be run independent, and connected to light riser at meter end, with right and left, union, or running thread.
8. Supply for gas engines must be separate, and an independent service will be required.
9. Drops in churches, schools, public halls, stores, double parlors, large rooms, etc., must not be less than  $\frac{1}{2}$  inch.
10. No riser in any building must be less than  $\frac{3}{4}$  inch and in stores must not be under deck of show windows, as meter will not be set there.
11. The riser in any building must not be less than 20 inches from the floor for two to ten openings; 2 feet 6 inches for ten to thirty openings; 4 feet for thirty to sixty openings; 5 feet for sixty to one hundred openings; 6 feet for over one hundred openings.

Where meters are to be set on wall, no riser must be higher than 9 feet from floor.

12. In all cases where extensions are made, care must be taken to break pipe where the rule for size can be maintained, and in no case shall extension be made from small pipes.

13. In flat buildings meters should be set in basement or in room provided for meters; otherwise in premises where gas is consumed.

14. All risers and building services must be brought to front of building and within 18 inches of wall or partition, and must not be less than 15 inches apart where risers are grouped.

15. In all cases where building service is used, provide header with an opening for each riser; where risers are in groups, openings must not be less than 15 inches apart.

16. Underground work by gasfitters between main and meter will not be allowed or accepted.

17. To avoid complications, gasfitters should consult this Company before locating risers in corner buildings.

18. In flat buildings where appliances are installed for the joint use of tenants, such as laundry stoves, driers, etc., run pipe from each meter to laundry and provide a header for a lock cock for each tenant. Fasten securely to each cock a metal tag with the flat number plainly marked thereon.

In cases where one common riser is desired, locate header in laundry and provide lock cocks and tags as provided above.

19. All work must be proved with mercury gauge, not less than a 6-inch column of mercury being allowed.

20. All pipe must be examined by the inspector of this company before being concealed, and twenty-four hours' notice must be given by gasfitters when any pipe is ready for inspection.

21. If the rules concerning the size of pipes are not clearly understood in each case, or if unusual conditions are met with, which the rules do not cover, communicate with the company's inspector.

22. It is the purpose of the company to strictly enforce the above rules, and no certificate of inspection will be given when they are not complied with.

23. Architects, builders and owners of buildings are requested not to allow a bill for gasfitting unless accompanied by a certificate of inspection.

# SIMPLE BASE PLATES FOR COLUMNS.

By N. Clifford Ricker, D. Arch.

Professor of Architecture University of Illinois.

## 1. Explanations:

The following formulas are arranged for base plates without webs and in accordance with the Chicago ordinances now in force. The maximum pressure in pounds per square inch on the masonry beneath the plate permitted by the ordinances is as follows:

On concrete masonry.....	173.61 pounds.
On dressed dimension stone.....	173.61 "
On rough dimension stone.....	138.89 "
On brickwork in best Portland cement.....	173.61 "
On brickwork in ordinary cement.....	125.00 "
On brickwork in lime mortar.....	90.28 "

The center of the plate should coincide with resultant of all loads on it.

A steel plate is of uniform thickness, being cut from a rolled plate.

A cast-iron plate is reduced in thickness from base of column to edge of plate, which is usually three-eighths of an inch thick or more, according to dimensions of the plate.

For simplicity, formulas for cast-iron plates are based on the assumption of sharp outer edges. When the edges have the usual thickness, the tendency to increase the tensile fiber stress is more than neutralized by the increased moment of resistance of the fracture section, making the formulas entirely safe for steel and cast iron. The line of fracture will be nearly straight.

The following maximum fiber stresses in pounds per square inch are prescribed by the ordinances:

Steel, tension or compression.....	16,000
Cast-iron = tension .....	2,500
Cast-iron in compression .....	10,000

## 2. Notation:

Let  $A$  = total area of base plate in square inches.

Let  $P$  = total pressure of plate on masonry in pounds.

Let  $p$  = maximum pressure in pounds per square inch.

$P$

Then  $A = \frac{P}{p}$  = required area of plate. (1.)

$P$

$a$  = area in square inches of portion of plate lying outside the fracture line.

$l$  = lever arm in inches of this area,  $a$  = distance from fracture line to its center of gravity.

$M$  = breaking moment in inch pounds acting at fracture line.

Then  $M = a p l$  = breaking moment. (2.)

$f$  = maximum permissible fiber stress in pounds per square inch.

$I$  = moment of inertia of fracture section, i. e., of vertical section along fracture line.

$c$  = distance in inches from neutral axis of fracture section to its most distant fiber.

$I$

Then  $f = \frac{M}{I/c}$  = moment of resistance of fracture section.

$c$

$t$  = thickness of plate in inches next base of column.

Equating breaking and resisting moments:

$$M = a p l = f \frac{I}{c} \quad (3.)$$

Which is the general equation employed.

### 3. Steel Square Plates:

Fracture line 1—2, Fig. 1. Substituting proper values of  $a$ ,  $l$ ,  $f$ ,  $I$  and  $c$  in general formula 3 and reducing:

$$t = \frac{k}{40} \sqrt{\frac{P}{10}} = \text{thickness.} \quad (4.)$$

Fracture line 3—4, Fig. 1:

$$t = \frac{k}{40} \sqrt{\frac{3P}{10}}. \quad (5.)$$

Fig. 1.

Apply formulas 4 and 5 and take the larger value found for  $t$ .

### 4. Steel Round Plate:

Fracture line 1—2, Fig. 2.

Join 1 and 2 with center  $C$ ; measure angle  $1 C 2 = \beta^\circ$ , subtending segment 1 B 2.

$$\text{Then } \frac{A \beta^\circ}{360^\circ} = \text{area of sector 1 B 2 C.} \quad (6.)$$

$$\frac{b r}{2} = \text{area of triangle 1 C 2.} \quad (7.)$$

Fig. 2.

Area sector — area triangle = area  $a$  of segment 1 B 2 outside fracture line 1—2. (8.)

And  $\frac{b^3}{12 a}$  = distance  $C'G$  in inches from center  $C$  to center of gravity  $G$  of segment area. (9.)

$$\text{Finally, } l = \frac{b^3}{12 a} r. \quad (10.)$$

Equating and reducing:

$$t = \frac{1}{40} \sqrt{\frac{3 a p l}{5 b}} = \text{thickness of plate.} \quad (11.)$$

### 5. Steel Octagonal Plate:

Fracture line 1—2 or 3—4, Fig. 3.

Area  $a$  can easily be found by dividing it into triangles. Locate center of gravity of area  $a$  by graphical method, and measure  $b$  and  $l$  in inches.

$$t = \frac{1}{40} \sqrt{\frac{3 a p l}{5 b}}. \quad (12.)$$

Fig. 3.

Apply formula at each fracture line and take larger value of  $t$ .

## 6. Cast-Iron Square Plate:

Fracture line 1—2, Fig. 4.

$$t = \frac{k}{50} \sqrt{2P}. \quad (13.)$$

Fracture line 3—4, Fig. 4.

$$t = \frac{1}{50} \sqrt{\frac{2P \left( K + \frac{K'}{2} \right)^2}{K + K'}} = \text{thickness}. \quad (14.)$$

Fracture line 1—2, Fig. 5.

$$t = \frac{K}{50} \sqrt{\frac{3P(2K + K')}{K + K'}}. \quad (15.)$$

Take largest value of  $t$  found by formulas 13, 14, 15.

## 7. Cast-Iron Round Plate:

Fracture line 1—2, Fig. 6.

Area  $a$  of segment outside fracture line is found, center of gravity  $G$  is located, and lever arm  $l$  is determined as for No. 4. The plate being a frustum of a very flat cone, the fracture section may be considered a parabola, which differs little from the actual hyperbola.

$$t = \sqrt{\frac{7apl}{2000b}}. \quad (16.)$$

## 8. Cast-Iron Octagonal Plate:

The fracture section being much more complex, a simple approximate formula is scarcely possible. Values of  $a$  and  $l$  can best be found graphically. Assume thickness  $t$ ; draw actual section; determine  $f$ ,  $I$  and  $c$  graphically:

compute  $f \frac{I}{c}$  and equate to  $M = a p l$ . Repeat until  $M = f \frac{I}{c}$ , when the corresponding value of  $t$  will be that required.

Fig. 4.

Fig. 5.

Fig. 6.

# COLUMNS IN FIREPROOF BUILDINGS.

Carnegie says: "The subject of fireproof construction is steadily growing in importance. The need of fireproof buildings in the business centers of our great cities has been well demonstrated, and their superiority has become so generally recognized that at present but few structures of any size or importance are designed which are not more or less of this type. This change has been facilitated in no small measure by a number of signal improvements made of late in the art of fireproof construction, insuring not only a higher degree of efficiency, but a considerable reduction in cost compared with methods formerly practiced.

"The old style of solid brick arch, once so prevalent in floor construction, has been almost wholly supplanted by the more modern forms of hollow tile and terra-cotta arches. Roofs, ceilings and partition walls are now also largely constructed of these light refractory materials.

"The substitution of steel for iron in beams may be cited as a radical improvement in this direction, and, simultaneously, the introduction of new patterns for steel beams.

"Another change which is gradually taking place is the substitution of steel for cast iron in the composition of columns. Cast iron is a material so uncertain in character that its use has long since been abandoned in bridge construction. In buildings the loads are generally quiescent and the liability to sudden shocks is more remote than in bridges; yet, on the other hand, the columns seldom receive their loads as favorably as in bridges; in most cases there exists considerable eccentricity, that is, the loads on one side of the column are heavier than those on the other side, and the bending strains arising therefrom increase the strains from direct compression materially.

"The following are some of the contingencies which may arise in the manufacture of castings and which preclude anything approaching uniformity in the product.

"In the case of hollow cast iron columns, while the metal is yet in a molten state the buoyancy of the central core tends to cause it to rise, thereby reducing the thickness of the metal above and increasing it below. When columns are of such a length as to make it necessary to pour the metal into the mold from both ends, it sometimes occurs that the iron becomes too much chilled on the surface to properly mix and unite, thus creating a weak seam at the very point where the greatest strength will be needed. The presence of confined air, producing "blowholes" and "honeycomb," and the collection of impurities at the bottom of the mold may be further mentioned as frequent sources of weakness in cast iron.

"The most critical condition, however, is that due to the unequal contraction of the metal during the process of cooling, thereby giving rise to initial stresses, at times of sufficient force to produce rupture in the column or in its lugs on the slightest provocation. In many cases the trouble can be ascribed to faulty designing or carelessness in the execution of the work, yet even under favorable conditions it is so difficult to secure equal radiation from the molds in all directions that castings entirely exempt from inherent shrinkage strains are probably seldom produced.

"As a protection against these contingencies resort must be had either to the crude and uncertain expedient of a high safety factor, not less than 8 or 10, or a material such as rolled steel must be adopted of a more uniform and reliable character than cast iron.

"Steel columns fall either by deflecting bodily out of a straight line, or by the buckling of the metal between rivets or other points of support. Both actions may take place at the same time, but if the latter occurs alone, it may be an indication that the rivet spacing or the thickness of the metal is insufficient.

"The rule has been deduced from actual experiments upon wrought iron columns, that the distance between centers of rivets should not exceed in the line of strain sixteen times the thickness of metal of the parts joined, and that the distance between rivets or other points of support at right angles to the line of strain should not exceed thirty-two times the thickness of the metal.

"As it is impracticable to repaint the inner surfaces of columns, they should preferably be used only for interior work, where the changes in temperature are not considerable and the air is comparatively dry. In places exposed to extremes of temperature and unprotected from the rain, the paint on the inner surface of the column will, sooner or later, cease to be a protection; corrosion will set in, and, once begun, is apt to continue as long as there is unoxidized metal left in the column.

"The length of a column unbraced should not exceed 125 times its least radius of gyration."

**WHY KINNEAR**  
Pressed Radiators  
are the Modern Type of Radiation

**KINNEAR  
PRESSED IRON  
RADIATOR**

**Kinnear Pressed Radiators**  
are desirable for  
Large Buildings, Hospitals and Homes

Kinnear Radiators occupy half the floor space of cast iron.  
Kinnear Radiators weigh less than one-fourth of cast iron.  
Kinnear Radiators produce heat much quicker than cast iron.  
Kinnear Radiators require half the volume of water or steam of cast iron.  
Kinnear Radiators afford reduction in cost of installation.  
Kinnear Radiators afford a saving in freight.  
Kinnear Radiators are absolutely sanitary.  
Kinnear Radiators, if desired, may be given a permanent plating.  
Kinnear Radiators will not burst from freezing.  
Kinnear Radiators combine great durability with least possible weight.  
Kinnear Radiators insure ease of installation without injury to interior woodwork or danger of overloading your floors.  
Kinnear Radiators are made from the best grade of sheet iron and are galvanized inside and out after assembling.

## HINTS ON HEATING AND FORMULA ON SAME.

### STEAM HEATING.

Steam heating has formerly been divided into two classes, high pressure, low pressure. High pressure steam heating is a system of the past except in very ancient and isolated cases. High pressure steam has to do now almost entirely with power. Such steam from the power plant as is used for heating purposes first passes through a pressure reducing valve and is allowed to pass into the heating system at a pressure of from two to five pounds only. So that steam heating may to-day be classified as low pressure and vacuum. Low pressure steam is designated by the system of piping used for its conveyance. To-day we have the overhead or Mills system, the two-pipe system, the one-pipe system, the single valve system. This last system has several subdivisions, such as the continuous circuit, the wet and dry return, etc. We will consider simply the single valve or pipe system.

The overhead or Mills system was patented by Mr. Mills of Boston, but in an address by him to the master steam fitters, at their convention in New York in 1890, was released to the use of the public. It consisted of a main riser to the top of the building, laterals above the highest radiators distributing the steam to the radiator risers with corresponding branches either on basement ceiling or below the basement floor, branches for the radiators being taken out from the riser below the floor line at the radiator. This system is very useful in large buildings or buildings having very little height in basement for suitable pitch of the main pipes. The two-pipe system is one that has been adopted for many years, though not now in general use. It consisted of a separate main at basement ceiling with corresponding return at or below basement floor, each radiator equipped with two valves, one for supply and one for return, the supply coming from main at basement ceiling and the return entering the main return at or below the basement floor. Into this return, also, at frequent intervals, is connected a branch from the main steam pipe, which acts as a bleeder or drip for conducting the water from the steam main back to the boiler. In this system the main steam and main return pipes, also the risers to and from the radiators may be of smaller size than are used in the single pipe or single valve system. The double pipe system has one advantage over the last mentioned, as by its use the valves may be partially opened without causing the hammering noise noticeable in the others, unless valves are either entirely closed or opened full. Its expense and the considerable cutting necessary for its installation are against it, though it must still be used where indirect radiation is wanted. The one-pipe system is nearly if not quite obsolete. It consisted of one pipe run from top of boiler to the radiator, the boiler being the low point, so that the steam and water of condensation traveled in opposite directions in the same pipe, which of necessity was of large diameter comparatively. This system was used very extensively in connection with the old sheet iron radiator.

The single valve system is the one most in use at the present time. Having steadily gained favor since about 1880, it is now almost universally adopted. In construction it is the reverse of the single pipe system (though often misnamed the single pipe system). The high point in the main pipe is at the boiler. The main pipe may be what is known as a continuous circuit, in which case it starts high at boiler, gradually falling as it passes around the basement back to the boiler, where it abruptly drops, entering the boiler at the bottom. The water and steam in the main travels in the same direction. The laterals or branches to the radiators are taken from the top of the main and the pitch is from the radiator to the main, the water and the steam, as in the single pipe system, thus traveling in reverse directions only in the branches to the radiators. The philosophy of the single valve system lies in

the fact that the transverse area of its one pipe and one valve equal nearly the transverse area of the two pipes and two valves of the two pipe system. As before stated, it is very necessary that the valves on the radiators of this system should be operated intelligently, as a valve opened partially, while permitting the steam to enter, will not permit the water (the result of the condensation of the steam) to return to the boiler. The least that can happen under these conditions is a very considerable noise in the radiator when the valve is opened until the water leaves the radiator. (It is the opinion of the writer that more than one-half the damage of cracked boiler sections can be laid to faulty manipulation of the radiator valve.)

Air valves upon radiators are important and preferably should be automatic, though whether automatic or not is a matter for the consideration of the user. The fact that the air must be expelled before the steam can enter the radiator to be condensed and yield up its heat necessitates their use. If automatic they should be non-adjustable and tinkering proof. A valve worked by air expansion is ideal for this purpose.

The thorough cleaning of the steam heating apparatus before permanent air valves are placed cannot be too greatly emphasized. Oil and sand cause more faulty working apparatus than any other cause, in apparatus that is otherwise well constructed. As a matter of fact apparatus on the verge of condemnation for general inefficiency has, in the experience of the writer, been converted into a first-class apparatus simply by a thorough cleaning and the use of chemicals to precipitate the oil, so as to facilitate its removal. To account for the presence of oil in an apparatus it is only necessary to call attention to the fact that beside the oil used in construction, all the cores over which the iron in the radiator sections, the boiler castings, and even the fittings is poured, are composed of oil and sand, part of which adhere to the inside of the castings. The steam condensing on these surfaces eventually carries this oil back to the boiler, where it lies like a blanket on top of the water. It may be removed by frequent blowing out of the boiler or a few cents' worth of chemical put into the boiler and circulated by steaming a few days, will permit of its being thoroughly cleansed by blowing it off once. This blanket of oil prevents the steam from passing through and the pressure frequently forces the water from the boiler up through the return pipes, and aside from the annoyance may easily become a dangerous condition. Why a condition so common has received so little attention is beyond finding out, and as it occurs in all steam heating apparatus this cleaning should be written in all specifications and insisted upon.

As to the size of mains, Professor Carpenter says: "The area of the main pipe must in every case be equivalent in carrying capacity to that of all the branches taken off; it consequently may be reduced as the distance from the boiler becomes greater or as more branches are supplied. It will in general be found, except when large pipes are used, less expensive to run the main full size rather than to use reducing fittings."

Find the area by multiplying the amount of radiating surface. If 1,400 feet or less, by .009; if 1,600 feet or more, by .008, and then use pipe with area nearest to that so found; thus radiating surface pipe will supply:

Diameter of Pipe.	Area in Inches.	—Radiation.—	
		Direct.	Indirect.
1¼ x 1 .....	1.49	150	85
1½ x 1¼ .....	2.03	225	140

### HOT WATER HEATING.

Heating by water or the vapor of water, i. e., steam, is accomplished in many ways, and has been utilized for the comfort of humanity for many years, and of late years is used exclusively for large buildings and almost universally for the modern homes and apartment buildings. The use of hot water for heating purposes is interwoven

with the history of Rome, though it has become a commercial proposition within the last thirty years, and to-day in the United States there are millions of dollars invested in factories and machinery for the production of apparatus for this purpose. When what may be called the modern hot water heating apparatus was introduced in 1875, it was considered good practice to run a separate pipe from the top of the boiler to each radiator, with a corresponding return pipe from each radiator to the bottom of the boiler. Where this system was put in with pipes properly proportioned relative to their length the circulation was perfect. However, the cost of such an apparatus was very high and led to the introduction of what is known as the two-pipe system, which is still highly recommended by some of the best heating engineers. About 1890 what is known as the one-pipe system was introduced, and as it could be installed at a much lower cost it has gained popularity and is used extensively. The overhead system, otherwise known as the Perkins system (though in the opinion of the writer should be credited to Mr. Mills of Boston), probably antedates the systems referred to above, but is used oftener under conditions that will not permit the use of the other systems mentioned, rather than from choice. Another system is referred to only that its use may be avoided. This system is known as the pressure system, and as its pressure is obtained by what is known as safety valves set so that a given pressure may be carried before they will open, it is considered dangerous and is not recommended by the best engineers. As a matter of fact, few, if any, accidents have ever happened to a hot water heating apparatus that have not been caused by undue pressure due to freezing of the open vent pipe or the safety valve failing to operate. The pressure system, owing to the fact that it may be installed cheaply, has a few advocates. With this system smaller radiators may be used, as under pressure a greater range of temperatures may be had. The advantages of the hot water apparatus are, however, practically all lost, as the friction incident to the circulation of the water through small pipes does away entirely with economy of operation, which, after all, is of much more consequence than low first cost.

Hot water heating apparatus cannot be too generous in its proportions, as low temperatures depend upon the size of the radiators, and slow combustion depends upon the size of the boiler. Slow combustion means economy. Comparing size of radiators with those of the steam apparatus, they should be at least as 8 is to 5, that is to say, that a radiator for hot water for a given space should be three-eighths larger than one for steam to heat the same space. It should be understood, also, that all hot water apparatus is always under pressure to the extent of the height of the column of water, one pound pressure for every 27 inches of height of the column.

In the open tank system the basement piping consists of supply and return mains of the same size running parallel or with return directly under the flow pipes and pitching upward from the boiler. What is known as the trunk system consists of one supply and one return main of equal size. These are run in pairs and each radiator has supply and return of same size.

Each radiator has a valve and union ell at the opposite end of it. If one main only is used the radiators on first floor should be supplied direct and should have larger connections. Radiators on the second and upper floors can be supplied from one branch. The ends of supply and return should be larger than the supply riser.

To find the size of mains multiply the radiating surface: When 1,800 feet and less, by .011; when 2,000 feet and over, by .009.

Size of Main.	Area.	Direct	Indirect

1510 MONADNOCK BLK.  
CHICAGO, ILL.

In the case of water being used, an expansion tank is necessary, for as the temperature of water rises until at the boiling point it is 5 per cent. greater than at 40 degrees the increase must be provided for, so that when cooled the system will still be full of water. It should be placed at a point above the highest radiator, the supply and return to it being connected to the supply and return of the nearest radiator, at a point below the radiator connection. No valves should be placed at any point that can possibly close the connection between the boiler and the tank.

To find the size of tank in gallons required, multiply the square feet of surface in the radiators, if the amount is less than 1,000 square feet, by .03; between 1,000 and 2,000 square feet., by .025; over 3,000 square feet, by .02.

An altitude gauge placed near the boiler will save watching the expansion tank. Fill the expansion tank to a point half way up the glass, and set the red hand of the gauge to indicate that point, and the movement of the movable hand will indicate the relative position of the water in the tank.

In the matter of radiation, the surface required is most important. In all cases the radiators should be placed as near the windows or outside exposures as possible. Low and curved window radiators add to the cost. Conditions vary considerably and must enter into the calculations of amount of radiation necessary. Glass exposure, wall exposure, cubic contents, location, exposure and construction of building must all be taken into account.

Ascertain the dimensions of room, the number of square feet of glass surface in windows and outside doors, figuring these doors as if glass, and measuring the entire opening of windows and door-frames. Ascertain the square feet of exposed wall surface, and deduct the glass surface as obtained above, and this will be the net amount of wall exposure. Reduce the wall surface to the equivalent of glass surface by dividing the net amount of wall exposure by 10 if the wall is from 8 to 10 inches thick, by 15 if from 12 to 26 inches thick, and by 20 if the wall is 26 to 38 inches thick. This result, added to the glass exposure, gives the glass equivalent of the glass and wall exposure. Multiply this glass equivalent by 75 (the cubic feet of air that each square foot of glass will cool per hour), and the product is the cubic feet of air to be heated to overcome the cooling effect of the glass and wall exposure. Now add to this the cubic contents of the room, and we have the total quantity of air to be heated.

It is customary to guarantee a temperature of 70 degrees in zero weather. To arrive at the amount of radiation under this guarantee multiply the quantity of air to be heated by the decimals given below, and the product will give number of feet required.

In localities where the temperature falls below zero, add to the amount of radiation obtained 1 per cent. for every degree below zero.

For Hot Water.—For temperature of water in radiators, 160 degrees, multiply by .0092; water in radiators, 170 degrees, multiply by .0081; water in radiators, 180 degrees, multiply by .0072.

For water use the multiple .0092; for if water is 175 degrees in flow and 145 degrees in return, the average is 160 degrees in radiation.

This is based upon using direct radiation, and provides for one change per hour. For more frequent changes increase the cubic contents by as many times as it is desired to change the air, the multipliers remain the same.

Direct radiation is surrounded by warm air, but cold air comes in contact more or less with their surfaces, in direct-indirect and indirect systems, so that for direct-indirect add 25 per cent. and for indirect 50 per cent.

#### EXAMPLE FOR DIRECT RADIATION.

Room— 16 feet wide, 20 feet long, 10 feet high.  
 4 windows, 3 feet wide, 5 feet high.  
 2 sides of room exposed to 0° weather.  
 10 inches thickness of wall.  
 $16 \times 20 \times 10 = 3200$  cubic feet of air in room.  
 $3 \times 5 \times 4 = 60$  square feet of glass in windows.  
 $16 + 20 \times 10 = 360$  square feet of wall surface exposed, including glass.  
 $360 - 60$  (glass) = 300 square feet actual amount of exposed wall surface.  
 $300 \div 10 = 30$  — glass equivalent in wall exposure.  
 $30 + 60 \times 75 = 6750$  — air in cubic feet cooled by windows and walls.  
 $3200 + 6750 = 9950$  — total in cubic feet of air to be heated.  
 $9950 \times .0055$  (multiplier for steam) = 54.72 radiation in square feet required to heat room.

Twenty-five years of practical experience in all classes of high and low pressure steam and water heating and power plants. The best material. First-class work and personal supervision insure our patrons the best results.

Indirect radiation is adopted where a large amount of ventilation is desired. It is particularly necessary in schools, hospitals and churches, and in dwellings one or two indirect stacks are desirable. This method of heating is decidedly more expensive than all direct radiation, and consumes more coal. It is frequently used in combination with direct radiation, and in this case ventilating flues must be provided. Either fireplaces or special flues from each apartment so warmed to the open air, and these flues (as well as from those conducting heat) must be placed in inside walls or partitions.

In installing this system the heating stacks are placed in the basement, connected to main supply and return pipes and encased with either galvanized iron, or narrow ceiling lined with tin. The cold air is introduced through air ducts from the outside, and after being warmed by contact with the indirect heating surfaces, is introduced into the rooms through tin flues and registers.

#### SIZES FOR CHIMNEYS.

A very essential adjunct to the working of a plant is the chimney flue, and the form of the flue has much to do with its effectiveness; thus as gases ascend in a spiral motion a round flue is the best, and a square one is better than one of rectangular shape. If of brick it should be evenly plastered. The flue should extend below the smoke pipe connection only a short distance to permit the removal of soot, if continued far below it will form an air pocket and cause down currents.

Square Feet of Direct Steam Radiation.	Horse Power.	Size of Chimney.	Square Feet of Direct Water Radiation.
250	2.5	8 x 8	400
500	5.0	8 x 12	850
800	8.0	12 x 12	1350
1400	14.0	12 x 16	2400
2200	22.0	16 x 16	3700
3500	35.0	16 x 20	5900
5500	55.0	20 x 20	9300
8000	80.0	20 x 20	13000

The ventilation of rooms is a very important factor. A certain amount of space is necessary to provide change of air, the circulation of which is of more importance than is generally attached to it, in this respect the indirect system of heating is advocated.

In theaters, churches, etc., provision should be made to admit from 400 to 1,500 cubic feet of air per hour for each person. In school rooms children should be provided with 600 cubic feet, and grown persons 1,200 cubic feet of air per hour. The Massachusetts law requires 30 cubic feet of fresh air per minute for each pupil, or 1,800 cubic feet per hour. This requirement represents the most advanced American practice. From 2,000 to 3,000 cubic feet of air per hour per occupant is required in hospitals and workshops. Each cubic foot of gas burned for illumination will consume from 8 to 12 cubic feet of air per hour.

The number of respirations men take on an average is 20 per minute, the volume of the air inhaled at each inspiration is equal to 40 cubic inches. The atmosphere of a lighted room containing several persons is vitiated to such an extent as to require a supply of fresh air equal to 4 cubic feet per minute for each.

Main supply pipes should run from top of boiler with a rising inclination of about  $\frac{1}{4}$  inch to 10 ft.

A cubic inch of water at 212° becomes very nearly a cubic foot of steam at the same temperature, expanding as it does into 1,696 times its volume.

Radiation for steam weighs about 7 lbs. per sq. ft.; for hot water, about  $7\frac{1}{2}$  lbs.

The circulation of the air is of more importance than is generally attached to it, and the indirect system by means of which fresh heated air is introduced is to be advocated. Fire places are of great use for purposes of ventilation.

#### FORMULA FOR CALCULATING RADIATION.

The following is successfully used by a prominent member of the C. A. B. A.:

First ascertain the cubical contents, glass surface (which includes the surface of all exterior doors and windows), take into account whether N., S., E. or W.

Let "I" be the inside temperature desired, say 70° Fahrenheit, "E" the coldest exterior temperature, "V" volume of room in cubic feet, "W" exterior wall surface of room in square feet, "G" exterior windows and doors in square feet, "R" standard amount of surface radiation in square feet, "F" factor depending upon method of heating or particular story heated. When hot water overhead system is used: 4 story building,

HOUSE HEATING A SPECIALTY. ESTIMATES FURNISHED

48 DEARBORN STREET

TELEPHONE CENTRAL 4328

CHICAGO

adopt 1.3 for first story, 1.2 for second, .90 for third and .60 for fourth. In 3 story buildings, 1.25 for first, 1 for second and .75 for third. For 2 story, 1.2 for first and .8 for second.

When the steam heating method is used, "F" becomes a constant equal to .8. "J" factor depending upon exposure equal to 1.4 for N., W. and N. W. exposures, equal to 1.2 for N. E. and S. W. exposures, equal to 1 for E., S. and S. E. exposures, and also for small interior courts and places well protected from north and west winds. For bath-rooms where a higher temperature is usually desired J is often made 2 instead of the usual rule. Kitchens where coal ranges are used, "J" is often made as low as .5, usually .75; but where there are no coal ranges "J" should be made 1-10 less than the factor obtained for the above.

$$\left\{ \frac{V}{400} + \frac{W}{10} + \frac{G}{2} \right\} \left\{ \frac{I-E}{I} \right\} .9 = R. \quad Q \text{ equals the desired square feet direct radiation}$$

surface for a room.  $Q = R F J$ . "E" is usually taken as  $10^{\circ}$  higher than the minimum recorded temperature of the locality. "I" is taken as  $70^{\circ}$ , therefore the quantity  $\left\{ \frac{I-E}{I} \right\} .9$

becomes a constant for any given locality, for Chicago where the minimum temperature is minus  $20^{\circ}$  the quantity is taken at 1.03.

The diameter of all supplies in inches should not vary materially from the square root of the amount of radiation to be supplied by the pipe, divided by 100. Reduced to inches, this rule is equally applicable to the supply of a single radiator or the supply of an entire system. Good judgment must go with the use of all empirical formula, especially in the use of the factor "J," which might be called the judgment factor. Location of surrounding buildings, trees, open space, etc., should be considered in the selection of a value for "J."

#### AUTOMATIC HEAT REGULATION.

Automatic heat regulation is now recognized as a very necessary item in the equipment of modern buildings, its use being justified on the grounds of fuel economy, comfort, and, in residence work, particularly, preservation of interior finish.

Its application naturally depends upon the character of the heating apparatus, it being essential in all cases that each heated apartment be supplied with at least one of the temperature controlling instruments called "thermostats," this "thermostat" regulating automatically the sources of heat supply for the apartment in which it is placed.

If the system of heating be direct radiation, the control of the radiators is accomplished by means of pneumatic diaphragm valves taking the place of the ordinary hand valves, these pneumatic valves being connected with the "thermostat." If indirect heat is used, the passage of the warm air through the heat flues is usually controlled by "mixing dampers," so arranged as to automatically mix hot and cold air in the proper proportions before it reaches the apartment, these mixing dampers being under the control of the "thermostats."

The heat regulation systems of recognized standing are generally operated by compressed air supplied by a suitable compressor in the basement, and distributed throughout the building by a system of galvanized iron and lead piping. The manufacturers of these systems invariably install the apparatus themselves, either as principal or sub-contractors, but in all cases executing to the owner a guarantee covering the operation and care of the system. The evidence seems to show that a saving of from 15 to 25 per cent in fuel consumption is accomplished in those buildings which are equipped with automatic heat regulation. This is a sufficiently large return upon the cost of the apparatus to justify its use in the majority of buildings. In residences, schools, etc., its use is imperative for hygienic reasons as well.

Specifications for temperature regulation should cover the system of piping to be installed minutely, as on the method of piping, and the size and kind of pipe used, depends, in a great measure, the success and durability of the system.

In connection with automatic control of temperature, there is also the control of the humidity of buildings, produced by artificial means. The question of humidity is a matter of great importance in buildings, and it is only since the invention of temperature regulation and the control of humidity that the device for producing humidity can be successfully installed.

## SHEET METAL RADIATION.

H. W. Nowell, member of the American Society of Heating and Ventilating Engineers, says: Sheet metal radiation has been in use for over fifty-four years, and in its varied forms is well known to be of more value as a heating agency than any other form or type of radiation. Undoubtedly one of the most efficient forms was the flat wall radiator invented in 1854, and one of more recent date in corrugated form, made in France, both of which are still being manufactured on special order. The writer has knowledge of these that have been in actual use for over thirty-nine years, and the efficiency and apparent durability has not in any manner depreciated. The sheet metal radiator made in this country, which, as stated before, was invented in 1854, was originally made of Swedish Bloom iron and buttoned together on its flat surface with copper rivets. The originals of this first line are in use to-day, but when other makes of radiation came into the market, the manufacturers of this radiator, in order to compete with the price, used a cheaper grade of metal which was apparently Bessemer steel and riveted with iron rivets. The life of these was very short. They were not galvanized; were made entirely by hand, and lap-jointed around the edge and soldered. The corrugated French radiator was made in a similar manner, riveted at the alternate points of corrugation. The writer has no record of the life of these, except a statement made by a manufacturer that he knew of their being in use for over thirty years. There was still another made up in tubular form, tube within tube, which was designed and used in Philadelphia twenty-eight years ago, and the writer knows of some of them still in use and claimed as giving better results than any other type of radiator.

The many different types of sheet metal radiation are conceded by engineers to be the most efficient, but questions have arisen regarding the durability, and pressures which they would stand, and along these lines the writer has had tests made of the metal used in the manufacture of a number of these, and chemists making the analyses and tests make unqualified statements that there should be no hesitation in guaranteeing this metal for any number of years.

Among the different types of sheet metal radiators, and the most modern, is one made along the lines of the cast iron radiator, in that it is of a vertical section type, and conceded to be more symmetrical and pleasing to the eye as to finish and design than other types, and have been demonstrated to stand 30 to 50 pounds pressure without leakage or bulging. Other features which appeal to the architect, engineer and steamfitter, are the lightness and space occupied by the sheet metal radiator, as the weight is about twenty-five per cent of the cast and space occupied about one-half. As to efficiency in comparison with cast and wrought tubes, some exhaustive tests have been made, which show that the latter is far superior as a heating agency.

Sometime in the year 1862 Professor Silliman of Sheffield Scientific School, New Haven, made tests, which were published, of the flat wall radiator. The efficiency was beyond that of the wrought tube radiator made at that time.

The sheet metal radiator made at the present time is manufactured of No. 18 and No. 20 metal, and the joints are pressed under heavy pressure and no solder is used. The sections are assembled by male and female joints expanded together as a boiler tube is expanded into a boiler head, after which the entire radiator is then treated chemically to remove any foreign matter, and they are then submerged into a large tank of molten zinc, which covers them completely both inside and outside, which prevents oxidation. The mechanical construction is such as to preclude any possibility of breakage by freezing or reasonable pressure, such as are used on present heating plants.

This paper is not written for the purpose or intention to advertise any distinct line of radiators, but purposely to bring forward a line of discussion or argument relative to the merits of sheet metal radiation, and for the benefit of all to receive what enlightenment we can on this class of radiation.

## HOW TO CONSTRUCT A TIN ROOF.

Roofs with less than one-third pitch are made with flat seams and should preferably be covered with the best kind of roofing tin, from sheets 14x20 inches dimension, rather than from sheets 20x28 inches, because the larger number of seams stiffen the surface and help to prevent buckles and rattling in stormy weather. For flat seam roof one-inch barbed and tinned roofing nails should be used, not over six inches apart, well under the edge. They should be well covered up and the seams should be pounded down over the edge with wooden mallet. Nails must never be exposed. The seams should be made with great care; sufficient time must be taken to properly "sweat" the solder into the seams.

Steep tin roofs should be made with standing seams and from sheets 20x28 inches. The sheets are first double seamed and soldered together into long strips that reach from eaves to ridge. The sloping seams are composed of two "upstands," interlocked and held in place by cleats. The standing seams are not soldered, but are simply locked together with the cleats folded in from 15 to 18 inches apart. Nails should be driven into the cleats only.

While it is always cheapest to use the best material, roofing plates with a lesser coating may be used for steep standing seam roofs. IC roofing plates, in which the iron body weighs 50 lbs. per 100 square feet, are more suitable than IX plates (62½ lbs. per 100 square feet), because the seams in the lighter plates will not suffer as much from contraction and expansion as the thicker plates.

For spouts, valleys and gutters heavily coated IX plate should always be used.

The amount of terne coating on the lighter sheets should in all cases be fully as heavy as on the heavier plates.

In late years the anxiety of some manufacturers to satisfy the demand of the people for cheap goods has been the cause of many inferior grades being introduced. This latter class of material may suit for some purposes outside of roofing or for roofs on temporary buildings, but for roofs that are expected to last, the "double dipped" and "extra coated" plates should be used.

The use of acid in soldering seams in a tin roof is to be carefully avoided; acid coming in contact with the bare iron on the cut edges and corners where the sheets are folded and seamed together will cause rusting. No other soldering flux but good rosin should be used. Every roof should be carefully cleaned and all rosin spots and detrimental substances should be removed as the tinner's work is being finished. Lumps of rosin left on the roof will melt in the sun, stick to the roof, cause blisters and prevent paint from adhering.

For valleys, spouts and gutters of a tin roof no other metal than terne plates should be used, because the galvanic action produced by different metals coming in contact with each other will cause disintegration under atmospheric influences.

The sheeting boards underlying the roofing tin should be put close together.

The wood should be well seasoned, dry and all knots should be culled out. It is also advisable to cover the boards with good building paper before the tin is laid on. The paper serves to exclude from the tin injurious vapors, gases, or fumes that continually rise from the rooms below.

When no paper is used the tin must in all cases be painted on the under side with good reliable oil paint before it is laid and fastened on the roof. The outside should receive two coats of paint as soon as the roof is finished.

To make tin roofs last for generations they should be repainted every three to five years with good iron oxide and linseed oil paint. The frequency of the intervals will depend largely on the climatic conditions of the country.

Reminders of quality remain long after the question of price is forgotten.  
Be satisfied only with the best.

For priming coat on all classes of natural wood.  
DRIES SUFFICIENTLY HARD OVER NIGHT TO ADMIT  
OF BEING SANDPAPERED. Forms a hard non-porous  
coating, which effectually prevents suction of the  
varnishes applied over it and holds them up to a  
remarkable degree.

FINISH NO. 2—For Interior Work.

Especially adapted for hallways, bathrooms,  
dining-rooms, kitchens, window sills, bar fixtures,  
and general inside house work, requiring a finish of  
EXTREME DURABILITY. Produces a beautiful luster  
over natural, painted or grained woods, and by cut-  
ting down with pumice stone and water, a SMOOTH  
DULL finish is obtained.

FLOOR FINISH

Combines quick and hard drying properties without sacrificing elasticity or durability.  
Dries hard over night under favorable conditions, WITH THE TOUGHNESS OF GUTTA PERCHA. On old and  
new natural wood floors properly filled, and on painted floors, ONE COAT IS SUFFICIENT. DOES NOT SCRATCH  
OR MAR WHITE, and is very durable.

THE VARNISH PROBLEM SOLVED.  
IN THE USE OF THE ABOVE BRANDS, YOU  
WILL HAVE NO FURTHER TROUBLE.

# POINTS ON VARNISH.

BY HERMAN ROSENBERG

**Drying and Hardening.**—Proper light and ventilation are absolutely necessary to facilitate drying and hardening. Varnish applied in buildings that are damp and not properly heated in cold weather, will be considerably retarded in drying and hardening. Extremely hot weather will also keep varnish soft for quite a time. The best results are obtained at a temperature of 70 to 75 degrees Fahrenheit.

**Turning White.**—It is caused by the action of water and dampness. The more elastic the varnish, the better it will resist this action, whereas, cheap, brittle, quick-drying varnishes are very easily affected.

**Brittleness.**—Is an inherent defect in the varnish caused by an excess of dryer, lack of oil, or by adulterated materials having been used in its manufacture. If a varnish powders white under friction of the finger or easily scratches white, that is incontrovertible evidence of its poor quality. Brittle varnishes should not be used even for the undercoats, as they destroy the toughness and durability of the finish, despite its being protected with an elastic, durable finishing varnish. It is poor economy, in any event, to use brittle varnishes, as the cost of application, which is the main expense, is the same as if good material were employed.

**Chilling.**—As its name implies, is caused by exposure to cold weather. Varnish should never be used while in this condition. To remedy is to keep the chilled varnish in a warm room, until it has been restored to its normal condition. Long exposure to cold weather may also cause the varnish to become "specky" and "seedy," in which event it is necessary to keep it near a steam pipe or warm stove for some time, until the chilled particles have disappeared.

**Cracking.**—Cracking is caused by the under coats not having been dry when the finishing coat was applied, or when abnormally heavy coats have been used, especially for the undercoats. Brittle varnishes are liable to crack when exposed to sudden changes of temperature.

**Blooming or Going Foggy.**—Is caused by exposure to dampness, moisture or gases, after the varnish has become hard. The more elastic the varnish, the less liable it is to "bloom" or become "foggy."

**Wrinkling, Crawling, Cramping or Sagging.**—Is caused by applying the varnish too heavily or by exposure to sudden changes of temperature while in the process of drying, or if the undercoats are not dry when the finishing coat is applied.

**Deadening or Sinking Away.**—Caused by the undercoats not having been allowed sufficient time to dry, causing the finishing coat to become absorbed while in the course of hardening. Insufficient foundation coats will also cause the finishing to sink away.

**Blistering.**—Is caused by the action of heat, especially from the concentrated rays of the sun, if sap or dampness is retained in the wood, or if moisture exists in the undercoats when the finishing coat is applied.

**Pitting.**—Is caused by applying varnish over an oily or damp surface; also, if the varnisher is not careful to thoroughly incorporate the turpentine in reducing the varnish, or uses improper thinning material.

**Knots and Sappy Woods.**—The sap and knots should be "killed" by the use of grain or wood alcohol shellac for the first coat. If this is not done, the sap will work through and injure the finish.

**Thinning.**—When found necessary, should be done with spirits of turpentine. In order to insure proper amalgamation, neither the varnish nor the turpentine should be too cold when mixing. The warmer the varnish and turpentine, the quicker the amalgamation. After reducing the varnish, allow it to stand awhile before using. Oil, Japan or liquid dryer should **never** be added to varnish.

**SWEATING.**—Is caused by rubbing the undercoat before it is thoroughly dry.

## VARNISHES.

Oil varnishes are the commercial products with which you have to deal. They are made by first skillfully selecting the gum, according to the kind of varnish to be made. The best exterior or coach varnishes come from the hardest and palest African gums, those from the north coast of Africa, Zanzibar and near-by islands being the most desirable. The gum is gathered by the natives. Some of it is centuries old, the age being determined by certain insects (some now extinct) found in the gum. The gum, upon its arrival here, must be carefully picked over, the cleanest and lightest pieces sorted out for use in the high-grade varnishes. The greatest care and long experience are very necessary in order to produce a successful end.

The melting of the gum is next in importance, the kind of pot or kettle to be used, etc. The linseed oil, which must first be absolutely pure and well settled (producing great body), then kettle boiled, the boiling of the oil being quite a skillful operation. Then comes the process of mixing the melted gum with the boiling oil; then the cooking or boiling of the varnish; afterwards cooling and thinning with the necessary amount of turpentine; lastly the clearing or filtering, which perhaps is the most important feature of the whole business. In England, where money is cheap, they take a much longer time to settle and age their varnish than we do, but by improved methods we are able to produce equal results in less than one-half the time.

I have told you how to make a superior outside finishing varnish, which is the most expensive. The cheaper or interior cabinet varnishes are simply a matter of less care in making; less expensive gums (usually the Kauri or Manila being used), and more easily combined or put together. The proportion of gum to the linseed oil used in making fine varnishes is 8 lbs. of gums to 3 gallons of linseed oil. Every manufacturer of varnish employs his own particular method.

The temperature at the time of using varnish cuts a very important figure. No good varnish can be properly applied in moist or freezing atmosphere. You needn't be particular as to quality if you are not particular when the varnish is used. Where it is used is also important. Don't expect an interior varnish to stand the weather. The greatest skill is required in laying on a varnish. To get the varnish on "right side out" is not an easy thing to do. We have to take the blame frequently for poor varnish when often it is poor workmanship.

The gum I mentioned as being used in high-grade varnishes comes from the north coast of Africa and is known by varnish makers as N. C. gum, for short. Now a maker could guarantee that his varnish was made of N. C. gum, when really it would contain resin that came from North Carolina and would be N. C. gum all right. You can only do as I suggested—patronize those who have a reputation to maintain—and not try to get through with your building by using cheap varnish, which means that you have not saved anything; on the contrary, your labor, which is three-quarters of the expense of painting or varnishing, costs you just as much whether you use good or bad material.

Gums and related articles which are used for preparing varnishes are derived from the vegetable kingdom. They have a very peculiar growth which may be likened to a disease that has its seat between the bark and wood of a tree.

Many of the gums are soluble in water, others in alcohol, etheric oils, turpentine, earth oils, etc. Oil obtained from linseed is especially essential for the production of varnishes.

# ELEVATING AND CONVEYING MACHINERY.

Paper read before the Chicago Architects' Business Association, Nov. 28, 1905, by A. G. Johnson.

## With Special Reference to the Handling of Freight and Packages.

In later years the use of elevating and conveying machinery has been greatly increased, and its advantage in comparison with trucks, industrial railways, platform elevators, etc., is being recognized more and more.

I will not try to explain all devices for all kinds of work, but will explain the most common types used in warehouses, wholesale and retail stores, and manufacturing plants, with special reference to the handling of packages.

### FREIGHT AND PACKAGE ELEVATORS.

Of the several types of elevators for handling packages, the most common is the suspended tray elevator, consisting of two strands of chain with trays or platforms, hung between at intervals, both being held in guides to prevent any swinging motion. The chains being endless are supported by sprocket wheels at the top, where power for turning same is applied, causing trays on one side to go up and on the other to go down, making a continuous movement of trays. In case the packages are small and no other method of discharge is necessary, the bottom of the tray is solid and packages are put on and taken off by hand. Where automatic loading and discharge is required, the trays are composed of a center bar, with cross arms fastened thereto. The loading brackets are composed of two sets of arms, the outside set being fastened to the floor and the inside to the framework of the elevator between the ascending and descending trays, and arranged to intermesh with the arms of the trays. The discharge brackets are arranged the same as the loading brackets, but are set at an incline. In operating, the packages are placed on the loading arms, picked up by the first ascending tray, carried up and passed between the head wheels, down on the other side to the discharging bracket, which intercepts and removes the package, allowing the tray to pass through. If more than one loading or discharge bracket is wanted, as in elevators going through several floors, the arms are mounted on shafts and in that manner arranged to swing out of the way when not in use. These elevators are built to suit size and weight of packages, and their economy is readily seen when in one instance an elevator of this type replaced four platform elevators, making a considerable saving in time and operating expenses, as no attendant is required, except where loading and discharging.

It is sometimes necessary that the ascending and descending trays face the same side of the elevator shaft, so that one person can attend both the loading and discharging on each floor, and in that case only one chain is used, with the trays overhanging in front and fitted with rollers at top and bottom of hanger, so as to overcome the twisting effect produced by the overhanging tray. Otherwise this machine works the same as the other swinging tray elevator, except that the arms in the tray are fastened to the back instead of to a center bar.

Another elevator that will serve the same purpose is constructed with trays having hangers in opposite corners. The head and foot shafts in that case cannot be in line, but must be offset to suit the width of the tray. The driving machinery for this elevator is therefore more complicated and takes more room than the other style and is therefore not used very often.

The last two styles of elevators should not be used for very heavy loads on account of their peculiar construction, and as the suspended tray elevator is so much superior, it ought to be used wherever possible.

For small and light packages a tray is sometimes used rigidly attached to the chains. This style is very often seen in retail stores where the shipping room is in the basement, in which case the packages are put on the tray by hand on the descending side and automatically discharged, when tray is going around the foot wheel. This elevator is also used for elevating packages and can be made to automatically discharge at the top by running the chains horizontally for a short distance over a discharge table and in that manner turn the trays to a vertical position, when the packages will slide off.

For elevating barrels and sacks from one floor to another, an elevator having two strands of chain with projecting arms is usually used. This elevator is run at a slight incline and guides are provided to support chain and load. Modifications of this elevator are used for handling boxes, trucks, railroad ties, bar iron, steel beams, etc., and when properly designed give very good satisfaction. There are also barrel elevators built with automatic arms that will elevate and automatically discharge at any desired floor. These are used in sugar and oil refineries, warehouses, etc., and also give good satisfaction. In all these machines the trays or arms are usually spaced 12 feet apart and are run at a speed of 60 feet per minute, giving a capacity of five trays per minute.

## SPIRAL CHUTES.

When packages are to be lowered from the upper floors to the lower, a spiral chute is the most economical, as no power is required and no machinery is employed. As the name indicates, it is merely a chute built in a spiral or like a screw, made steep enough to make packages slide down by gravity at a reasonable speed. An outside casing is provided to completely enclose it and this casing is provided with doors at each loading point that will automatically close in case of fire. They are now used a great deal in stores and manufacturing plants and are even used as fire escapes at some of our school buildings here in Chicago.

## FREIGHT AND PACKAGE CONVEYORS.

For conveying very light packages and other material, the belt conveyor is generally used, consisting of an endless belt supported at intervals by rollers, spaced usually four to five feet apart on the carrying side and 12 feet on the return side, making a very smooth running and noiseless machine. For belt conveyors handling packages the supporting rollers are usually made concave and of wood, with a steel shaft through the center, supported in ball-bearings or in common babbitted boxes fitted with grease cups to insure good lubrication, as it is very important that the rollers work easily. For handling material in bulk, like grain, coal, sand, etc., the supporting rolls on the carrying side are arranged to bend the belt so as to form a trough, in which the material is handled. These rolls should be so designed that no abrupt bending is produced in the belt and that the minimum friction in the bearings of the rolls is obtained.

For heavy packages the belt conveyor is not practicable and what is commonly called the apron conveyor is then used, consisting generally of two strands of chain, with slats bolted to same, making a continuous and endless apron. For short centers and small packages the apron is supported and slides on guides, but for long conveyors, or where very heavy packages are handled, the apron is mounted on rollers reducing the friction to a minimum, and consequently reducing the strain on chains and driving machinery and the power used in operating. The apron conveyors can be made to run horizontally or at an incline to suit conditions, but in the latter case pushers or blocks are provided to prevent packages sliding back if the incline is too steep. They are used for various purposes, as, for instance, handling light and heavy packages, boxes and trucks in stores and warehouses, for loading and unloading general freight to and from vessels, in which case they are mounted on frames made adjustable to suit the varying heights of vessels.

Sometimes very curious problems must be solved, and to illustrate what can be done in special cases, I will describe a conveyor installed sometime ago in the packing room of a candle factory. This room was arranged for packing table around three sides and with the nailing table near the fourth. The conveyor being installed close to the wall, and at the same height as the packing table on the three sides, made a turn opposite to the nailing table, and when reaching that went down through the floor, along ceiling of the story below, and up again to the packing floor. This made an open space in the system so as to get to and from the room. The operation is as follows: The packing girls take the empty boxes and place them on the table, fill them with candles and put them on the conveyor, which then takes them around and discharges onto the nailing table, where covers are put on. This conveyor made three horizontal turns in the packing room and this was accomplished by using the so-called "Dodge" chain, which is a long-pitch cable chain equipped with bearing blocks and the construction is such that it can turn any angle desired.

The supervising architect is sometimes called on to decide the merits of different designs of elevating and conveying machinery, and I wish to call attention to some points that should always be considered.

The chain being the most important part of the machine, should be so designed as to give ample bearing surface for the pin, and the pressure of not more than 2,000 pounds per square inch of the projected area ought to be allowed on the wearing surface. In chains used for inclined and horizontal conveyors handling heavy packages large rollers should be provided, and these rollers ought to be provided with some kind of self-oiling device, insuring good lubrication at all times and with the least attendance. All machines employing chains should run very slowly, both on account of the wear of the moving parts and also on account of the noise produced at a high speed. This is especially true where long pitch chains are used. In wholesale and retail stores and public buildings noise is very objectionable, and in machines used in such places all gearing should be cut and other provisions made to reduce the noise as far as possible.

I may also add that manufacturers of elevating and conveying machinery are always willing to design and build machinery to suit any special case, and will also give assistance to architects in designing new buildings where elevating and conveying machinery are to be employed.

## DAMP PROOFING.

Lecture before the Chicago Business Association May 20, 1906, by Dr. Maximilian Toch:

Mr. President and Gentlemen:—The early history of waterproofing is clouded very much in mystery, for the reason there is little or no literature on the subject, and it must therefore be taken very much on faith and information.

The first successful waterproofers were the Romans, as they were the first successful manufacturers of cement, and waterproofing consisted primarily in building foundation walls which were so thick it was difficult for water to penetrate. At the time Cæsar invaded Gaul, about 2,000 years ago, the Romans found a mineral which is now known as Cerusite, and this they melted and from which they obtained lead. The metal was too soft, however, for technical use, but they soon discovered on rolling it into thin sheets it corroded only on the surface, and corrosion went no further, and this sheet lead is still found to-day as a waterproofing material in the foundations of many of the ancient structures.

The use of sheet lead for conveying water has been found to be more suitable than other materials, for the reason that the white scum which forms does not go any further, and this is an oxide which seems to protect the lead underneath it. Where iron pipes are used for conveying water they in time rust out completely. So we have to thank the Romans for the real introduction of waterproofing on foundation walls. During the feudal times the method of protection that was practiced by the ancients was to build castles, and around these castles were built moats. The ancient Britains and Normans soon found that the water penetrated into the cellars or dungeons of the castles, and where these dungeons were used for prison purposes they cared not whether they were damp or dry, but they found later on that the seepage of the water undermined the foundations, and so they were compelled to keep the water out, which, in some cases, they did with sheet lead, but more often with huge stones filled in with cement, and so no progress was made on the question of waterproofing until coal tar was found to be an incidental product to the manufacturer of coal gas, and the English were the first to utilize coal tar as a waterproofing material.

Coal tar, as it was originally made, was the black semi-fluid material which remained behind in the stills after the extraction of the coal gas. Unless this liquid was still further distilled it separated itself into the lighter oils, and the product which remained behind in the still was called "pitch."

Coal tar pitch and coal tar liquid are materials which must be applied in a hot condition, and their value as waterproofing materials in conjunction with fabric in various thickness running from three to ten ply. The tar is of undoubted value, but wherever there is a leaky gas main, a mixture of illuminating gas and seepage water always destroy coal tar waterproofing. It so happened that some of the stations of the subway in New York City were found to leak after they had been completed, and the water which came through the waterproofing was impregnated with illuminating gas; in order to overcome this, a new waterproofing fabric, known under the name of Benzol Proof Cloth, was used.

Quite a number of years ago, I think it was in 1879, when the Obelisk was first brought to Central Park, New York, it was found that in a very few months it began to show signs of disintegration, and Prof. R. Ogden Doremus, who was at that time a well-known chemical expert, was consulted as to the application of a material to the Obelisk for its preservation. This illustrated the remarkable difference in climate, for the Obelisk had stood perfectly for 3,000 years in Egypt, and within six months after its arrival to New York the temperature changes had begun to affect it. On the east coast of the United States, in the vicinity of New York, there is a temperature change of 130 degrees, and during the year our thermometer frequently goes as low as 10 degrees below zero., and the summer season mounts to as high as 120 degrees. Out here I believe the temperature variation is about 145 degrees, and this explains why some of the building materials, particularly cement, are not suited for this climate. I do not wish you to infer that a large body of cement or concrete will not withstand the temperature variations, but I do know that in Belgium the manufacture of cement tiles has existed successfully for over 300 years, and these tiles are not more than 1 inch thick, and that the manufacture of the same tiles made in this country of the same material have not withstood our climate for one year. And so it was when Professor Doremus was consulted on this subject of waterproofing of the Obelisk against the ravages of the elements, he concluded that the application of hot paraffin would be the proper method and material; this was done, and although this was over 25 years ago and no second application of hot paraffin has ever been applied to the Obelisk, I know that the Monolith has been

perfectly preserved since then. This hot paraffin method is the outcome of what is known as the "Caffall Process," and I understand it is excellent excepting for the lighter stones, on which it unfortunately acts as a dust and dirt collector. There are quite a number of other cement and stone waterproofing materials on the market which are solutions of paraffin, some of which were examined and found to contain a very small percentage of low melting point paraffin, and these are to be avoided, for they are only temporary materials which are worth but a few cents per gallon and are sold at prices beyond their real value.

Another material which has been successfully used in Europe is the invention of Professor Hauenschield in connection with Kessler, of fluo-silicate of magnesia, known technically under the name of Fluote. The Paris Opera House, the Kaiser's Palace in Potsdam and a great many other buildings in Europe were all treated with this material, and it serves an excellent purpose, for it hardens stone and makes it rainproof at the same time, but this beneficial effect is not instantaneous, for it takes more than a year to demonstrate itself.

About 16 years ago, when fireproof construction became quite prominent in New York City and the question of taking away the air space had to be solved, my firm invented a material which when applied to the inside of outside walls, either over brick construction or hollow brick, would retain the plaster, do away with the air space and prevent moisture from coming through. A material of this kind could not, of course, contain any tar, for the reason any tarry material would stain the plaster on the inner surface of the room. A material of this sort had to be alkali proof, for the lime in the cement and in the brown coat should not affect it, and yet I have the most remarkable story to tell in connection with this—that it took our concern over five years to educate the architects and builders to the use of it against most insurmountable difficulties. To-day no prominent building is erected without the use of some of this material somewhere, and one of the largest buildings I know of in New York, which has cost up to \$10,000,000, has this Damp Resisting Paint applied on the walls, back of the ceilings and under the floors. It took so long to educate the public in the use of this material that the time for its patent had elapsed and now it is unfortunate that similar materials have imitated it, and to my knowledge no less than twelve substitutes appeared on the market and then gradually disappeared as the material failed. Its use as a waterproofing material and insulating material in cold storage buildings has made it many friends, for the immovable air in the air space and absolute freedom of odor and taint of the material have much to do with the success of the cold storage plant.

## GRAVEL ROOFING.

Appended are three specifications for good work:

### **Five (5) Ply Wool Felt, Composition and Gravel Roof.**

First cover the sheathing boards with one (1) layer of dry felt and over this put four (4) thicknesses of wool roofing felt, weighing not less than fifteen (15) pounds (single thickness) to the square of one hundred (100) feet. This felt to be smoothly and evenly laid and well cemented together the full width of the lap, not less than nine (9) inches between each layer, with best roofing cement, using not less than one hundred (100) pounds of roofing cement to the square of one hundred (100) feet. All joinings along walls and around openings to be carefully made. The roof to be then covered with a heavy coating of roofing cement and screened gravel, not less than one (1) cubic yard of gravel to six hundred (600) square feet, gravel to be screened through  $\frac{5}{8}$ -inch mesh and free from sand and loam. All walls and openings to be flashed. If not, the rear end of the walls to be flashed not less than fifteen (15) feet from the gutter on each side.

### **Six (6) Ply Cap Sheet Wool Felt, Composition and Gravel Roof.**

First cover the sheathing boards with one (1) layer of dry felt and over this put four (4) thicknesses of wool roofing felt, weighing not less than fifteen (15) pounds (single thickness) to the square of one hundred (100) feet. This felt to be smoothly and evenly laid and well cemented together the full width of the lap, not less than nine (9) inches between each layer, with best roofing cement, using not less than one hundred and twenty (120) pounds of roofing cement to the square of one hundred (100) feet. The entire surface then to be mopped over with roofing cement and a cap sheet of wool felt applied. All joinings along the walls and around the openings to be carefully made. The roof to be then covered with a heavy coating of roofing cement and screened gravel, not less than one (1) cubic yard of gravel to six hundred (600) square feet, gravel to be screened through  $\frac{5}{8}$ -inch mesh and free from sand and loam. All walls and openings to be flashed. If not, the rear end of the walls to be flashed not less than fifteen (15) feet from the gutter on each side.

### **Six (6) Combined Flax and Wool Felt, Composition and Gravel Roof,**

First cover the sheathing boards with one (1) layer of dry felt and over this put one (1) layer of flax felt and three thicknesses of wool roofing felt, weighing not less than fifteen (15) pounds (single thickness) to the square of one hundred (100) feet. This felt to be smoothly and evenly laid and well cemented together the full width of the lap, not less than eleven (11) inches between each layer, with best roofing cement, using not less than one hundred and twenty (120) pounds of roofing cement to the square of one hundred (100) feet. The entire surface then to be mopped over with roofing cement and a cap sheet of wool felt applied. All joinings along walls and around openings to be carefully made. The roof to be then covered with a heavy coating of roofing cement and screened gravel, not less than one (1) cubic yard of gravel to six hundred (600) square feet, gravel to be screened through  $\frac{5}{8}$ -inch mesh and free from sand and loam. All walls and openings to be flashed. If not, the rear end of the walls to be flashed not less than fifteen (15) feet from the gutter on each side.

## MISCELLANEOUS AND USEFUL INFORMATION.

### Useful Notes.

Roof boards weigh about three pounds per superficial foot.

Terra cotta tiling weighs from 25 to 35 pounds per square foot.

Hollow tile for five-inch partition weighs from 22 to 35 pounds per superficial foot.

Lath and plastering, two-coat work, weighs from 9 to 12 pounds per superficial foot.

The weight of a superficial foot of brickwork eight inches thick, including mortar, is from 83 to 87 pounds.

An iron roof 100 feet wide, with a rise of one-third pitch, will weigh from 10 to 15 pounds per superficial foot.

One hundred pounds per square foot distributed uniformly over a surface of a bridge is a safe working standard.

The weight per square foot of roof tiling, set in iron or between wood rafters ready for slating, is about 12 pounds.

A fireproof floor constructed of iron beams and four-inch brick arches will weigh from 65 to 75 pounds per superficial foot.

The safe and proper bearing of joist, timber and girders supporting a floor should not exceed ten tons on brick walls and fourteen tons on good stone walls.

A fireproof floor constructed of iron beams and of iron arches made of No. 18 iron, and filled in on top with concrete or slag and cement, will weigh about the same as brickwork four inches thick.

Smallest convenient size of slab for a 14-inch washbowl, 21 by 24 inches. Height of slab from floor, 2 feet 6 inches. Very small (12) inch corner washbowl: slab 1 foot 11 inches each side.

Space occupied by water closets, 2 feet 6 inches wide, 2 feet deep.

Urinals should be not less than 2 feet 2 inches between partitions; partitions 6 feet high.

Horse Stalls.—Width, 3 feet 10 inches to 4 feet, or over 5 feet in width and 9 feet long. Width should not be between 4 and 5 feet, as in such cases the horse is liable to cast himself.

Pitch of Tin, Copper or Tar and Gravel Roof.—Three-eighths of an inch to the foot and upward.

A load of mortar measures a cubic yard, requires a cubic yard of sand and nine bushels of lime, and will fill thirty hods.

A bricklayer's hod measuring one foot four inches by nine inches, equals 1,296 cubic inches in capacity, and contains twenty bricks.

A single load of sand or other materials equals a cubic yard.

One thousand bricks closely stacked occupy about fifty-six cubic feet.

One thousand old bricks cleaned and loosely stacked occupy about seventy-two cubic feet.

One hundred yards of plastering will require fourteen hundred laths, four and a half bushels of lime, four-fifths of a load of sand, nine pounds of hair and five pounds of nails, for two-coat work.

A bushel of hair weighs, when dry, about fifteen pounds.

Flashings.—By "flashings" are meant pieces of tin, zinc or copper laid over slate, and up against wall, chimneys, copings, etc.

Counter flashings are of lead or zinc, and are solid between the courses in brick, and turned down over the flashings.

In flashing against stonework, grooves should be cut to receive the counter flashing.

## Water.

1 cubic foot of water equals 62.5 pounds, or 7.48 U. S. gallons.

1 cubic inch of water equals .036 pounds.

1 cubic foot of water equals 6.2355 Imp. gallons or 7.48 U. S. gallons.

1 cylindrical foot of water equals 49.1 pounds or 5.89 U. S. gallons.

1 U. S. gallon of water equals 8.34 pounds.

1 U. S. gallon of water equals 231 cubic inches.

1 pound pressure per square inch is equivalent to a head of water of 2.3093 feet;

1 pound—27.71 inches; 14.7 pounds or 1 atmosphere—33.947 feet, or 10.347 metres; 0.433 pound or 1 atmosphere—1 foot; 43.3 pounds—100 feet.

## Capacity of Cisterns.

For a circular cistern, square the diameter and multiply by .7854, for the area; multiply this by 1.728 and divide by 231, for number of gallons of one foot in depth; for a square cistern, multiply length by breadth, and proceed as above.

### CIRCULAR CISTERN.

5 feet in diameter holds 4.66 bbls.

6 feet in diameter holds 6.71 bbls.

7 feet in diameter holds 9.13 bbls.

8 feet in diameter holds 11.93 bbls.

9 feet in diameter holds 15.10 bbls.

10 feet in diameter holds 18.65 bbls.

### SQUARE CISTERN.

5 feet by 5 feet holds 5.92 bbls.

6 feet by 6 feet holds 8.54 bbls.

7 feet by 7 feet holds 11.63 bbls.

8 feet by 8 feet holds 15.19 bbls.

9 feet by 9 feet holds 19.39 bbls.

10 feet by 10 feet holds 23.74 bbls.

## Tests for Pure Water.

**Color:** Fill a clean long bottle of colorless glass with the water; look through it at some black object. It should look colorless and free from suspended matter. A muddy or turbid appearance indicates soluble organic matter or solid matter in suspension. **Odor:** Fill the bottle half full, cork it, and leave it in a warm place for a few hours. If when uncorked it has a smell the least repulsive, it should be rejected for domestic use. **Taste:** If water at any time, even after heating, has a disagreeable taste, it should be rejected.

A simple semi-chemical test is known as the "Heisch test." Fill a clean pint bottle three-fourths full of the water; add a half-teaspoonful of clean granulated or crushed loaf sugar; stop the bottle with glass or a clean cork and let it stand in a light and moderately warm room for forty-eight hours. If the water becomes cloudy, or milky, it is unfit for domestic use.

## Expansion of Water (Dalton).

Temperature.	Expansion.	Temperature.	Expansion.	Temperature.	Expansion.
22°	1.0009	72°	1.0018	152°	1.01934

## Rules for Calculating Speed of Pulleys.

I.—The diameter of the driver and driven being given, to find the number of revolutions of the driven:

Rule.—Multiply the diameter of the driver by its number of revolutions, and divide the product by the diameter of the driven; the quotient will be the number of revolutions.

II.—The diameter and the revolutions of the driver being given, to find the diameter of the driven, that shall make any given number of revolutions in the same time:

Rule.—Multiply the diameter of the driver by its number of revolutions, and divide the product by the number of revolutions of the driven; the quotient will be its diameter.

III.—To ascertain the size of the driver:

Rule.—Multiply the diameter of the driven by the number of revolutions you wish to make, and divide the product by the revolutions of the driver; the quotient will be the size of the driver.

## Belts.

Leather belts must be well protected against water, and even moisture.

India-rubber is the proper substance for belts exposed to the weather.

It is desirable to run the grain (hair) side of leather belts on the pulley, in order that the strongest part of the belt may be subject to the least wear.

Leather belts run with grain side to the pulley will drive thirty per cent more than if run with flesh side. The belt, as well as the pulley, adheres best when smooth, and the grain side adheres best because it is smoothest.

The transmitting power of a double belt is to that of single belt as 10 is to 7. In ordering pulleys, the kind of belt to be used should always be specified.

Belts should be kept soft and pliable. For this purpose blood-warm tallow, dried in by heat of fire or the sun, is advised. Castor-oil dressing is also good.

The motion of driving should run *with* and not *against* the laps of the belts.

If too great a distance is attempted, the weight of the belt will produce a very heavy sag, drawing so hard on the shaft as to produce great friction in the bearings, while at the same time the belt will have an unsteady, flapping motion, which will destroy both the belt and machinery.

If possible to avoid it, connected shafts should never be placed one directly over the other, as in such case the belt must be kept very tight to do the work. For this purpose belts should be carefully selected of *well-stretched* leather.

It is desirable that the angle of the belt with the floor should not exceed 45 degrees. It is also desirable to locate the shafting and machinery so that belts should run off from each shaft in opposite directions, as this arrangement will relieve the bearings from the friction that would result when the belts all pull one way on the shaft.

The diameter of the pulleys should be as large as can be admitted.

The pulley should be a little wider than the belt required for the work.

When it is not convenient to measure with the tape line the length required, apply the following rule: Add the diameter of the two pulleys together, divide the result by 2, and multiply the quotient by  $3\frac{1}{4}$ , then add this product to twice the distance between the centers of the shafts, and you have the length required.

The width of belt needed depends on three conditions: 1. The tension of the belt. 2. The size of the smaller pulley, and the proportion of the surface touched by the belt. 3. The speed of the belt.

The working adhesion of a belt to the pulley will be in proportion both to the number of square inches of belt contact with the surface of the pulley and also to the arc of the circumference of the pulley touched by the belt. This adhesion forms the basis of all right calculation in ascertaining the width of belt necessary to transmit a given horse-power.

The average width of a shingle is four inches. Hence, when shingles are laid four inches to the weather each shingle averages 16 square inches, and 900 are required for a square of roofing (100 square feet). If  $4\frac{1}{2}$  inches to the weather, 800; 5 inches, 720;  $5\frac{1}{2}$  inches, 655; 6 inches, 600.

**Weight per Square Foot of Sheet Lead.**

$\frac{1}{32}$ inch thick.....	2 lbs.	$\frac{1}{10}$ inch thick. . . . .	7 lbs.
$\frac{1}{16}$ " " .....	$2\frac{1}{2}$ "	$\frac{1}{8}$ " " .....	8 "

**Grade Per Mile.**

The following table will show the grade per mile:  
An inclination of

1 foot in 15 is 352 feet per mile.	1 foot in 40 is 132 feet per mile.
1 foot in 20 is 264 feet per mile.	1 foot in 50 is 106 feet per mile.
1 foot in 25 is 211 feet per mile.	1 foot in 100 is 53 feet per mile.
1 foot in 30 is 176 feet per mile.	1 foot in 125 is 42 feet per mile.
1 foot in 35 is 151 feet per mile.	

To find quantity of water elevated in one minute running at 100 feet of piston speed per minute: Square the diameter of the water cylinder in inches and multiply by 4. Example: Capacity of a 5-inch cylinder is desired. The square of the diameter (5 inches) is 25, which, multiplied by 4, gives 100, the number of gallons per minute (approximately).

To find the depth of a joist, the length of bearing and the thickness being given:

Rule.—Divide the square of the length in feet by the thickness in inches, and the cube root of the quotient, multiplied by 2.2 for pine, or 2.3 for oak, will be the depth in inches.

**Slating.**

Slating is estimated by the "square," which is the quantity required to cover 100 square feet. The slates are usually laid so that the third laps the first three inches.

### Number of Slates per Square.

Size in Inches.	Pieces per Square.	Size in Inches.	Pieces per Square.	Size in Inches.	Pieces per Square.
6 × 12	533	8 × 16	277	12 × 20	141
7 × 12	457	9 × 16	246	14 × 20	121
8 × 12	400	10 × 16	221	11 × 20	137
9 × 12	355	9 × 18	213	12 × 22	126
7 × 14	374	10 × 18	192	14 × 22	108
8 × 14	327	12 × 18	160	12 × 24	114
9 × 14	291	10 × 20	169	14 × 24	98
10 × 14	261	11 × 20	154	16 × 24	86

The weight of slate per cubic foot is about 174 pounds, or per square foot of various thicknesses as follows:

Thickness in inches.....	$\frac{1}{8}$	$\frac{3}{16}$	$\frac{1}{4}$	$\frac{3}{8}$	$\frac{1}{2}$
Weight in pounds.....	1.81	2.71	3.62	5.43	7.25

### Handy Table.

Diameter of a circle  $\times 3.1416 =$  circumference.  
 Radius of a circle  $\times 6.283185 =$  circumference.  
 Square of the diameter of a circle  $\times 0.7854 =$  area.  
 Square of the circumference of a circle  $\times 0.07958 =$  area.  
 Half the circumference of a circle  $\times$  half its diameter  $=$  area.  
 Circumference of a circle  $\times 0.159155 =$  radius.  
 Square root of the area of a circle  $+ 0.56419 =$  radius.  
 Circumference of a circle  $\times 0.31831 =$  diameter.  
 Square root of the area of a circle  $\times 1.12838 =$  diameter.  
 Diameter of a circle  $\times 0.86 =$  side of inscribed equilateral triangle.  
 Diameter of a circle  $\times 0.7071 =$  side of an inscribed square.  
 Circumference of a circle  $+ 0.225 =$  side of an inscribed square.  
 Circumference of a circle  $\times 0.282 =$  side of an equal square.  
 Diameter of a circle  $\times 0.8862 =$  side of an equal square.  
 Base of a triangle  $\times \frac{1}{2}$  the altitude  $=$  area.  
 Multiplying both diameters and .7854 together  $=$  area of an ellipse.  
 Surface of a sphere  $\times \frac{1}{6}$  of its diameter  $=$  solidity.  
 Circumference of a sphere  $\times$  its diameter  $=$  surface.  
 Square of the diameter of a sphere  $\times 3.1416 =$  surface.  
 Square of the circumference of a sphere  $\times 0.3183 =$  surface.  
 Cube of the diameter of a sphere  $\times 0.5236 =$  solidity.  
 Cube of the radius of a sphere  $\times 4.1888 =$  solidity.  
 Cube of the circumference of a sphere  $\times 0.016887 =$  solidity.  
 Square root of the surface of a sphere  $\times 0.56419 =$  diameter.  
 Square root of the surface of a sphere  $+ 1.772454 =$  circumference.  
 Cube root of the solidity of a sphere  $\times 1.2407 =$  diameter.  
 Cube root of the solidity of a sphere  $\times 3.8978 =$  circumference.  
 Radius of a sphere  $\times 1.1547 =$  side of inscribed cube.  
 Square root of ( $\frac{1}{3}$  of the square of) the diameter of a sphere  $=$  side of inscribed cube.  
 Area of its base  $\times \frac{1}{3}$  of its altitude  $=$  solidity of a cone or pyramid, whether round, square, or triangular.  
 Area of one of its sides  $\times 6 =$  surface of a cube.  
 Altitude of trapezoid  $\times \frac{1}{2}$  the sum of its parallel sides  $=$  area.

### Table for Mixing Paints.

In forming the following named colors, mix as they come in order, the predominant being first; second, next; third, next, and so on:

- Gray*—use white lead and lampblack.
- Buff*—use white lead, yellow ochre and red.
- Pearl*—use white, black and blue.
- Orange*—use yellow and red.
- Purple*—use violet, red and white.
- Gold*—use white, stone ochre and red.
- Olive*—use yellow, blue, black and white.
- Chestnut*—use red, black and yellow.
- Flesh*—use white, yellow ochre and vermillion.
- Limestone*—use white, yellow ochre, black and red.
- Fawn*—use white, yellow and red.
- Chocolate*—use raw umber, red and black.
- Drab*—use white, raw and burnt umber; or, white, yellow ochre, red and black.
- Bronze-Green*—use chrome green, black and yellow; or, black and yellow; or, yellow, black and green.
- Pea-Green*—use white and chrome green.
- Rose*—Use white, madder and lake.
- Copper*—use red, yellow and black.
- Lemon*—use white and yellow.
- Snuff*—use yellow and vandyke brown.

### Shingle Stains

Should contain a large amount of creosote for their base, and the highest grades of English ground colors, and the proper amount of fixative oil to make the colors durable and lasting. Stains are artistic colorings, and give an effect that can be got in no other way. Stains can be applied with a brush, as paint is, after the shingles are laid, or the shingles can be dipped in the stain. The coloring effect is about the same in either case, but the dipping preserves the shingles best.

Covering capacity, based on the regulation sawed cedar shingle, 4 by 16, is as follows: One brush coat, 1 gallon to 150 square feet of surface; two brush coats, 1 gallon to 100 square feet of surface; dipping,  $2\frac{1}{2}$  gallons to  $2\frac{3}{4}$  gallons to 1,000 shingles; dipping, and applying one brush coat after the shingles are laid, 3 gallons to 1,000 shingles. But two-thirds the length of the shingle need be dipped. When the roof-water is to be used for drinking, it should be turned off from the cistern until two or three hard rains have washed off the superfluous stain.

---

Dimensions of a Barrel.—Diameter of head, 17 inches; bung, 19 inches; length, 28 inches; volume, 7,680 cubic inches.

One coat or priming will take, for 100 yards of painting, twenty pounds of lead and one and one-fourth gallons of oil. Two-coat work, forty-five pounds of lead and two and one-half gallons of oil; three-coat work, seventy pounds of lead and three and three-fourths gallons of oil.

A box 24 inches long by 16 inches wide and 28 inches deep will contain a barrel, or three bushels; 24 by 16 inches and 14 inches deep contains half a barrel; 16 inches square and  $8\frac{3}{4}$  inches deep will contain one bushel; 16 by  $8\frac{3}{4}$  inches and 8 inches deep will contain half a bushel; 8 by  $8\frac{3}{4}$  inches and 8 inches deep will contain one peck; 8 inches square and  $4\frac{1}{2}$  inches deep will contain one gallon; 7 by 4 inches and  $4\frac{1}{2}$  inches deep will contain half a gallon; 4 inches square and  $4\frac{1}{2}$  inches deep will contain one quart; 4 feet long, 3 feet 5 inches wide and 2 feet 8 inches deep will contain one ton of coal, or 36 cubic feet.

## Hot-Water and Steam Heating—Overhead System.

In using steam for the heating of high buildings, it is necessary to use the overhead plan, unless some automatic system of expelling the air is adopted. It requires less power to force the air through the standpipe than it would through a large number of risers. The air is forced out on the descent of the steam, and less fuel and power are necessary.

The overhead hot-water system is coming into general use, as it can be put in so that the farthest radiators in a building will heat at the same time as those nearer the boiler, and the result will also be felt in rooms in the basement—the principle of the siphon causing the effect.

The pipes from the main in the attic, from which the several branches are taken, can be pitched so that heat in the several parts of a building will result as quickly as desired; either an open or closed tank can be used. The pipes exposed in attic should be covered. Opinions vary as to the sizes of pipe to be used.

### RADIATION REQUIRED UNDER ORDINARY EXPOSURE.

	Width.	Length.	Height.	Ratio.	Square feet of radiation.
Parlor.....	15.6	16.6	10.0	50	51
Dining room.....	12	16.6	10.0	60	34
Hall.....	12	12	10.0	25	57
Chamber, front.....	13.6	15.6	9.6	55	36
Chamber, rear.....	12.6	16.6	9.6	60	32
Chamber.....	12.6	17	9.6	60	33
Bathroom.....	7	8	9.6	55	9
Chamber, attic.....	12.3	17	9	76	24
Chamber, rear.....	12.6	13.3	9	80	18

### List of Sizes of Steam Mains.

To determine the size of pipes no fixed rule can be given which will apply in all cases. A rule that has generally been accepted by steam fitters as good practice, is to allow the area of a one-inch pipe (.7854 square inches) for every 100 square feet of radiating surface, including mains.

Radiation.	One-pipe work.	Two-pipe work.
40 to 50 square feet.....	1 inch.....	$\frac{3}{4}$ x $\frac{3}{4}$ inch
100 to 125 square feet.....	$1\frac{1}{4}$ inch.....	1 x $\frac{3}{4}$ inch
125 to 250 square feet.....	$1\frac{1}{2}$ inch.....	$1\frac{1}{4}$ x 1 inch
250 to 400 square feet.....	2 inch.....	$1\frac{1}{2}$ x $1\frac{1}{4}$ inch
400 to 650 square feet.....	$2\frac{1}{2}$ inch.....	2 x $1\frac{1}{2}$ inch
650 to 900 square feet.....	3 inch.....	$2\frac{1}{2}$ x 2 inch
900 to 1,250 square feet.....	$3\frac{1}{2}$ inch.....	3 x $2\frac{1}{2}$ inch

8,100 to 10,000 square feet.....	10 inch.....	9 x 6 inch

## Tin Roofs.

Tin roofs should be laid with cleats.

There are two kinds of tin—"bright tin," the coating of which is all tin, that is, the tin proper; and "tern," "leaded," or "roofing" tin, the coating of which is a composition, part tin and part lead. This last will not rust any quicker, but the sulphur in soft coal smoke eats through the "leaded" coating sooner than through the "tinned."

Sizes of tin, 10 by 14 and 14 by 20, and two grades of thickness—IC light, and IX, heavy. For a steep roof (one-sixth pitch or over) the IC 14 by 20 tin ("leaded" if high up where little smoke will get to it; "bright" if low down), put on with a standing groove, and with the cross seams put together with a double lock, makes as good a roof as can be made. For flat roofs IX 10 x 14 "light" is best, laid with cleats, **but** the others make good roofs and any of them will last twenty-five years at least, if painted periodically.

Number of Square Feet a Box of Roofing Tin Will Cover.—For flat seam roofing, using  $\frac{1}{2}$ -inch locks, a box of "14 by 20" size will cover about 192 square feet, and for standing seam, using  $\frac{3}{8}$ -inch locks and turning  $1\frac{1}{4}$  and  $1\frac{1}{2}$  inch edges, making 1-inch standing seams, it will lay about 168 square feet.

For flat seam roofing, using  $\frac{1}{2}$ -inch locks, a box of "28 by 20" size will cover about 399 square feet, and for standing seam, using  $\frac{3}{8}$ -inch locks and turning  $1\frac{1}{4}$  and  $1\frac{1}{2}$  inch edges, making 1-inch standing seams, it will lay about 365 square feet.

Every box of roofing plates (IC or IX "14 by 20" or "28 by 20" sizes) contains 112 sheets.

## Strains.

Tension, as in the case of a weight suspended from one end of a rod, rope, tie-bar, etc., the other end being fixed, tending to stretch or lengthen the fibers.

Shearing strain, as in the case of tree nails, pins in bridges, etc., where equal forces are applied on opposite sides in such a manner as to tend to force one part over the adjacent one.

Compression, as in the case of a weight resting on top of a column or post, tending to compress the fibers.

Transverse or cross strain, as in the case of a load on a beam tending to bend it.

Torsion, a twisting strain, which seldom occurs in building construction, though quite frequently in machinery.

## Important Points in Figuring Dimensions of a Stable.

The proper height and width of a stable door is not less than nine feet square. Width and height of vehicles is as follows:

	Height.		Length.		Width.	
	Ft.	In.	Ft.		Ft.	In.
Brougham .....	7	0	11		6	0
Rockaway .....	7	0	11		6	0
Victoria .....	7	6	12		6	0

1 ounce troy, or apothecary (480 grains)..<	31	grammes . . . . .	31.103
1 cubic centimeter . . . . . [bulk]..	1.06	cubic inch . . . . .	1.060
1 cubic inch . . . . .	16⅓	cubic centimeters . . . . .	16.386
1 liter (1,000 cubic centimeters).....	1	U. S. standard quart.....	0.946
1 United States quart . . . . .	1	liter . . . . .	1.057
1 fluid ounce.....	29½	cubic centimeters . . . . .	29.570
1 hectare (10,000 square meters) [surface]	2½	acres . . . . .	2.471
1 acre . . . . .	0.4	hectare . . . . .	0.40

In the nickel five-cent piece of our coinage is a key to the tables of linear measures and weights. The diameter of this coin is two centimeters, and its weight is five grammes. Five of them placed in a row will give the length of the decimeter, and two of them will weigh a decagram. As the kiloliter is a cubic meter, the key to the measure of length is also the key to the measure of capacity.

### Size of the Billiard Room, Gas Light, Etc.

The space required for the different sized tables is as follows:

For table 6	x 12.....	Room should be 16	x 22
For table 5½	x 11.....	Room should be 15½	x 21
For table 5	x 10.....	Room should be 15	x 20
For table 4½	x 9.....	Room should be 14	x 18½
For table 4	x 8.....	Room should be 13	x 17
For table 3½	x 7.....	Room should be 12½	x 16

The following directions for arranging the lights over billiard tables will be found useful. The distance of the light from the floor should be about 6 feet 2 inches. For a 5½ by 11 table, cross-arms 31 inches and long arms 62 inches. For a 5 by 10 table, the cross-arms of the pendant should measure, from light to light, 28 inches and the long arm 56 inches. For a 4½ by 9 table, cross-arms 25 inches and long arms 50 inches. For a 4 by 8 table, cross-arms 22 inches and long arms 44 inches.

\* The Standard U. S. gallon of 231 inches.

Multiply the external circumference column, A, by 12 and the result will be the square feet of surface per lineal foot

**Quantity of Brickwork in Barrel Drains and Wells.**

Diameter in Clear	Thickness of Brickwork	Superficial Feet of Brick- work in One Linear Yard.	Number of Bricks Required for One Linear Yard

LAW OF SPECIFIC HEAT—In order to raise the temperature of different bodies the same number of thermometric degrees very different amounts of heat are required. The atoms of the solid element possess sensibly the same specific heat.

DUCTILITY—The property of being drawn into wire or threads.

MALLEABILITY—The capacity of being extended in all directions by beating with the hammer.

Table of greatest center loads for horizontal rectangular beams of white or yellow pine, or of spruce, 1 inch broad, supported at both ends, and required not to bend more than  $\frac{1}{40}$  inch per foot of clear span, or  $\frac{1}{80}$  part of the entire clear span. In practice, to allow for knots, &c, take only  $\frac{2}{3}$  rds. This table was calculated with a constant .000325, instead of .00032.

The loads in this table include the weight of the clear beam itself; .625 of which (or % of which) must be deducted from the tabular loads to get the net load, when the beam is loaded at its center. When uniformly loaded, the loads will be 1.6 times as great as those in this table; but in that case the weight of the entire clear beam must be deducted. In practice this deduction need rarely be made.

CLEAR SPANS IN FEET. (TRAUTWINE)																	Depth in Inches.	Wt. of 10 ft. in Lgth of Beam.

On this side of the dark lines, the safe loads of table. **Iron and Steel.** would not bend the wooden beams as much as  $\frac{1}{4}$  of their clear span.

Average cast iron, with the same safe def will bear about  $11\frac{1}{2}$  as much as common yellow or white pine, or spruce; and wrought iron 19 times as much. The same proportion of the weight of the beam itself must, however, be deducted as stated above for wood. Average steel 29 times as much as pine.

On this side of the dark lines, the safe loads of table,  $\frac{2}{3}$  would not bend the wooden beams as much as  $\frac{1}{80}$  of their clear span.

Average cast iron, with the same safe def will bear about 11% as much as common yellow or white pine, or spruce; and wrought iron 19 times as much. The same proportion of the weight of the beam itself must, however, be deducted as stated above for wood. Average steel 29 times as much as pine.

Safe Loads in Tons of 2,000 Lbs. for Hollow Rectangular Cast Iron Columns.

## Corrosion of Steel and Iron

**C**=Coefficient of Corrosion during 1 year's exposure in pounds avoirdupois per square foot.  
(For value of C see table.)

**W**=Weight in pounds of 1 foot in length of section exposed.

**L**=Length in feet of the perimeter exposed. If both the inside and outside perimeter are exposed to the Corrosive influence both must be included.

**Y**† The number of years of life of the metal.

$$\text{Formula } Y = \frac{W}{C L}$$

**Table of Value of C.**

	Corroding Agents.

"    "    "    "    gun metal.....						.4537

### Example=Steel.

**W**=12-in. x 12-in. x 1½-in. x .283=20.376 pounds.

**L**=1 ft. 0-in.

**C**=.1252 from table.

$$Y = \frac{W}{C L} = \frac{20.376}{.1252 \times 1} = \frac{20.376}{.1252} = 162.667 \text{ years.}$$

The corrosion of steel unprotected in manufacturing districts of cities would therefore amount to 20.38 pounds in 162.67 years of the above dimensions of block of steel, or in that time it would be entirely consumed by oxidization.

## NAILS REQUIRED FOR DIFFERENT KINDS OF WORK.

For 1,000 shingles, 3½ to 5 lbs. 4d. nails, or 3 to 3½ lbs. 3d.

For 1,000 laths, about 7 lbs. 3d. fine.

For 1,000 feet clapboards, about 18 lbs. 6d. box.

For 1,000 feet covering boards, about 20 lbs. 8d. common, or 25 lbs. 10d.

For 1,000 feet upper floors, square edged, about 38 lbs. 10d. floor, or 41 lbs. 12d. floor.

For 1,000 feet upper floors, matched and blind-nailed, 38 lbs. 10d., or 42 lbs. 12d. common.

For 10 feet partitions, studs or studding, 1 lb. 10d. common.

For 1,000 feet furring, 1x3, about 45 lbs. 10d. common.

For 1,000 feet furring, 1x2, about 65 lbs. 10d. common.

For 1,000 feet pine finish, about 30 lbs. 8d. finish.

For roofs and gutters use seven-pound lead; for hips and ridges, six-pound; for flashings, four-pound.

Gutters should have a fall of at least one inch in ten feet.

No sheet lead should be laid in greater length than ten or twelve feet without a dip to allow for expansion.

Joints to lead pipes require a pound of solder for every inch in diameter.

Memoranda for Breweries.

29	140	190	250	310	380	460	550	650	750	860	980	
30	130	180	240	300	370	450	530	630	730	830	950	

This table has been calculated for extreme fiber strain of 1,000 lbs. per square inch, giving a safety of 6 in ordinary building timber of fair quality.  
 Oak and yellow pine will carry a load one-fourth greater.  
 When more accuracy is required the weight of the beam itself must be deducted.  
 Care must be taken to let the beams rest for a sufficient distance on their supports to guard against crushing at the ends, especially in placing very heavy loads upon short, but deep and strong beams.

## FORMULAE FOR ASCERTAINING STRENGTH OF BEAMS.

To ascertain the strength of a beam of any given size, or materials, multiply its width (in inches) by the square of the depth (in inches) and divide by the span (in feet)—multiply the quotient by the constant (co-efficient of strength) of material used, and the result will be the breaking load.

In ordinary practice a sixth of the “breaking” would be a “safe load.”

Width in inches × sq. of depth in inches

Center breaking load in lbs. =  $\frac{\text{Width in inches} \times \text{sq. of depth in inches}}{\text{Clear span in feet}} \times \text{constant}^*$

Example: To ascertain the safe centre load in lbs. for a white pine beam 8 inches wide, 12 inches deep, 16 feet clear span.

$$\frac{\text{Width (in inches)} \times \text{square of depth (in inches)}}{\text{Clear span (in feet)}} \times \frac{\text{constant}^*}{\text{factor of safety.}}$$

$$\frac{8 \times 144}{16} \times \frac{450^*}{6} = 5,400 \text{ lbs.}$$

\* Constants or transverse strengths in lbs. for center loads are:

American white pine.....450 lbs.

American yellow pine.....550 lbs.

American white oak.....600 lbs.

Constants are for loads at rest.

Where beam is loaded at the center to get neat load, deduct ½ weight of beam.

Where beam is uniformly loaded the strength is double, to get neat load deduct entire weight of beam.

## LIMES, CEMENTS, PLASTERS.

**Limes and Cements.**—Natural limes and cements are produced by calcining limestones and other calcareous materials, in which process the carbonic acid and moisture they contain are driven off.

**Hydraulic Limes** are calcined from stone containing 73 to 92 per cent. of carbonate of lime, and a portion of clay, also soluble silica, carbonate of magnesia, alkalies, metallic oxides, and sulphates.

**Cements.**—There is no precise line between hydraulic limes and cements, the latter containing a larger proportion of clay than limes.

**Natural Cements** are calcined from stones containing carbonate of lime, a mixture of carbonate of lime and magnesia, together with a proportion of from 30 to 50 per cent. of clay. More than 40 per cent. of clay is injurious to the cements.

**Hydraulic Cements** are artificial cements made in a similar manner to hydraulic lime, but with a larger proportion of clay, silica, alumina, magnesia, etc. They do not slack after calcination, and some set under water at a temperature of 65 degrees in from 3 to 5 minutes and others in as many hours.

**Portland Cement** is an artificial cement. Good cement should be ground very fine, and should weigh from 95 to 130 pounds to the striked bushel. Slow setting cement is strongest. It is very important that sand used with cement be perfectly clean and sharp.

**Mortar** is lime and sand mixed with water. The setting process is a chemical change, the lime and the carbonic acid in the air combining to form a carbonate of lime, which as a cementing element encloses and binds together the particles of sand. The sand should be perfectly free from clay, loam or other impurities, or substitutes for sand may be used in the shape of well burnt clay, coriae from iron-works, slag from furnaces and cinders from coals.

**Gypsum**, or hydrated sulphate of lime is the basis of most plasters. It is a soft stone, which is either simply calcined, or calcined and combined with salts and alkalies.

**Plaster of Paris** is gypsum gently calcined till nearly the whole of the moisture is driven off. It can be cast in almost any form in wax or guttapercha moulds. It is also used with other plasters to quicken the setting.

**Keene's Cement** is plaster of paris soaked in a solution of alum and recalcined.

**Parian Cement** is gypsum calcined and powdered and mixed with a solution of borax, recalcined, ground, and mixed with a solution of alum.

**Coarse Stuff** is lime water mixed with hair or fiber.

**Fine Stuff** is lime slaked to a paste run to the consistency of cream, and allowed to harden to the required consistency for working by evaporation.

**Gauged Stuff** is plaster of paris added in the proportion of about 1 to 4 for its more rapid setting.

**Rough Cast** is washed gravels mixed with hot hydraulic lime; it is thrown with large trowels in a semi-fluid state upon an even surface of coarse stuff, and colored with lime wash and ochre.

**Depeter** is a "pricked up" coat of coarse stuff, into which small stone are pressed while in a wet state.

**Depretor** is plaster finished with a surface similar to cooled stone.

**Pugging** is coarse stuff put between floors for the purpose of deafening.

**Papier Mache** is paper reduced to a pulp or sheets of paper glued together and pressed in a metal mould to a required form.

**Carton Pierre** is similar to papier mache, but made with paper pulp, whiting and size, pressed into plaster moulds.

**Fibrous Plaster** is plaster of Paris in a thin coat laid on canvas strained on framework.

### CROSSES.

The cross, a symbol of Christianity, has very naturally been extensively used in the monuments of the middle ages. When the two branches of the cross are equal in length, as in Fig. 1, the cross is called a Greek cross, and when the stem is longer than the arms, as in Fig. 2, it is a Roman or Latin cross. When the figure has two arms, one longer than the other, as in Fig. 3 (the upper one meant as a representation of the inscription which was placed over the head of Christ) it is known by the name of the Lorraine cross, and has received that name from its being a bearing in the arms of the Dukes of Lorraine. By heralds this is called a patriarchal cross. The next cross, whose arms are triple, as Fig. 4, is the papal cross, and is one of the emblems of the papacy, signifying, perhaps, like the triple crown or tiara, the triple sovereignty over the universal church, the suffering church and the triumphant church. The great majority of the western churches, with transepts, are constructed in the form of the Latin cross, those in the form of the Greek cross being very rare. Those in the form of the Lorraine cross are still rarer, and rarer are those constructed with triple transepts. There is another form called the truncated or tau cross, as Fig. 5, having the form of that letter, on which, as a plan, a few churches have been built. Considered as respects the contour, the cross in blason has been variously shaped and named. Thus, Fig. 6, in which the extremities widen as they recede from the center, is called a cross pattee. This is met with more frequently than any of the others. It is seen in the nimbus, on tombs, on shields, upon coins, etc.; and is the usual form of the dedication cross found in religious structures. Fig. 7 is by the French called ancree, the extremities forming hooks, but by heralds it is called the cross moline. Crosses fleury are those in which the ends are formed into trefoils, as is seen in Fig. 4, the papal cross above mentioned. Fig. 8 is a cross potent, and Fig. 9 is the cross clechee, as respects the outer lines of its form; when it is voided, as shown by the inner lines, the ground or field is seen on which it lies.

### MEASUREMENT OF OLD BRICKS.

Uncleaned rough from building dumped from 8 to 10 bricks per cu. ft.

Uncleaned stacked on outside and interior filled promiscuously, 10-12 per cu. ft.

Cleaned and stacked, 16 to 18 bricks per cu. ft.

Cleaned, stacked on outside and interior filled promiscuously, 12-14 per cu. ft.

### RULE FOR CALCULATING PROPORTIONED WIDTH AND HEIGHT OF TREADS AND RISES OF STAIRS

Subtract the width of tread from 25 in. and the result will be twice the height of the riser. Thus: if the tread is 10 in. wide, then  $25 - 10 = 15 \div 2 = 7\frac{1}{2}$  in., the height or riser proportionate to a 10-inch tread. This is exclusive of nosings.

## MEMORANDA FOR PAINTERS.

(From "Builders' Guide and Price Book.")

Painters' work is generally estimated by the yard, and the cost depends upon the number of coats applied, besides the quality of the work, and the material to be painted.

One coat or priming, will take, for 100 yards of painting, twenty pounds of lead and four gallons of oil. Two-coat work, forty pounds of lead and four gallons of oil. Three-coat work, the same proportionate quantity as two coats; so that a fair estimate for 100 yards of three-coat would be 100 pounds of lead and sixteen gallons of oil.

One gallon priming oil color will cover 50 superficial yards.

One pound of paint covers about four superficial yards the first coat, and about six each additional coat. One pound of putty, for stopping every twenty yards.

One gallon of tar and one pound of pitch will cover twelve yards superficial the first coat, and seventeen yards each additional coat.

A day's work on the outside of a building is 100 yards of first coat, and 80 yards of either second or third coat. An ordinary door, including casings, will, on both sides, make eight to ten yards of painting, or about five yards to a door without casings. An ordinary window makes about two and one-half or three yards.

### RULE FOR FINDING THE REQUIRED AREA FOR ANY CHIMNEY.

Multiply the nominal horse-power of the boiler by 112, and divide the product by the square root of the height of the chimney in feet. The quotient will be the required area in inches, at the top of chimney.

Table showing diameter and height of chimney for any boiler:

Horse-Power of Boiler.	Height of Chimney in feet.	Interior Diameter at top.	Horse-Power of Boiler.	Height of Chimney in feet.	Interior Diameter at top.
10	60	14 in.	70	120	30 in.
12	75	14 "	90	120	34 "
16	90	16 "	120	135	38 "
20	99	17 "	160	150	43 "
30	105	21 "	200	165	47 "
50	120	26 "	250	180	52 "
60	120	27 "	380	195	57 "

### WEIGHT OF BRICKWORK.

Placing the weight of brickwork at 112 lb. per cubic foot, the weights per superficial foot for different walls are:

9 inch wall.....	84 lb.
13 inch wall.....	121 lb.
18 inch wall.....	168 lb.
22 inch wall.....	205 lb.
26 inch wall.....	243 lb.

### ACOUSTICS.

The effect of length, height and width of rooms on their acoustics.—A writer in the "Arch. and Bldr." says: "To half the width of room add height of platform and height of the speaker, for height of room from floor to ceiling. The length of room from speaker may be  $1\frac{1}{2}$  to twice the width, but should not exceed 90 ft." From examples of halls which have proved exceptionally successful for music, it appears that the height which would be far too great for a building for public speaking seems distinctly favorable for musical effect. A ratio of height to width and length should be as 2, 3 and 5, these proportions having proved eminently successful for music halls. For theaters no person should be over 70 feet from the speaker. The best shape for an auditorium is probably horse-shoe.

## TO FIND THE RADIUS OF AN ARCH.

Centers—The following is the method to find the radius for arch centers  $S =$   
 span  $R =$  rise  
 Then  $\left\{ \frac{\left(\frac{S}{2}\right)^2}{R} + R \right\} \div 2$  or: To the square of half the span  
 divided by the rise, add the rise and divide this sum by 2, and the result will be the  
 radius required.

Example:—Suppose an arch 20 feet span and 5 feet rise then:

$$\left\{ \frac{10^2}{5} + 5 \right\} \div 2 = \frac{20 + 5}{2} = 12 \text{ ft. 6 in. the radius required.}$$

## IRON GIRDERS.

The equal corresponding weight in the center of a girder caused by a certain  
 ascertained weight coming at any other point of the same girder.

$W =$  Known Weight.

$L =$  The whole length between the bearings.

$D =$  Distance between resting point of  $W$  and the furthest support.

$D' =$  Distance between resting point of  $W$  and the nearest support.

$E =$  Half the distance between the supports.

$x =$  The equal corresponding weight or strain in the center.

$$\text{Then } x = \frac{WE}{D}$$

Example.—Let  $A B$  be a girder 12 ft. long with a girder resting on it 4 ft. from  
 $A$  with a known resultant weight of 5 tons, then  $x$  or strain at  $C$  (center)

$$\begin{aligned} & \frac{5 \times 6}{8} \\ & = \frac{\quad}{8} \text{ or } 3\frac{3}{4} \text{ tons.} \end{aligned}$$

To resolve the weight  $W$  into the two concurrent parallel forces at  $A$  and  $B$ , or  
 the resultant weight or strain at the bearings. Taking the above example.

$$\text{Strain at } B = \frac{WD'}{L} \text{ or } \frac{5 \times 4}{12} = 1\frac{2}{3} \text{ tons.} \quad \text{Strain at } A = \frac{WD}{L} \text{ or } \frac{5 \times 8}{12} \text{ or } 3\frac{1}{3} \text{ tons.}$$

When a beam is fixed at one end only, and has to support a weight uniformly  
 distributed over the length the form of equal strength is a triangle, supposing the  
 beam to be everywhere the same, but if the section of beam be circular, then the  
 form of equal strength will be a semi-cubic parabola.

A cast iron girder if made too deep will be too rigid, and a comparatively small  
 impulsive force will break it, the outline of the compressed side or top flange of a  
 C. I. girder if to bear a weight uniformly distributed should be an arch the radius of  
 which equals the square of half the length divided by the depth or

$$\frac{L}{2} \Big)^2 \div d \text{ where } L = \text{length of Girder between the bearings.}$$

$d =$  depth of Girder.

If the depth is obliged to be uniform then the outline of the breadth should be  
 formed by setting two parabolas base to base, their verticals being in the middle of  
 the length.

## HINTS ABOUT PAINTING IRON.

Before painting iron, it should be thoroughly scraped, brushed and cleaned  
 from all scale or rust.

Lead paints should not be applied to iron, as they erode the surface of the  
 metal instead of protecting it. Oxide of iron paint is found both theoretically and  
 practically to be anti-corrosive.

## VELOCITY OF WIND.

10 miles, per square foot,	0.49 lbs.	50 miles, per square foot,	12.304 lbs.
20 miles, per square foot,	1.97 lbs.	60 miles, per square foot,	17.733 lbs.
30 miles, per square foot,	4.43 lbs.	70 miles, per square foot,	24.153 lbs.
40 miles, per square foot,	7.87 lbs.	100 miles, per square foot,	49.200 lbs.

## LIQUID MEASURE.

31½ gallons = 1 barrel.	2 pints = 1 quart = 67.2 c. inches.
2 barrels = 1 hogshead.	4 quarts = 1 gallon = 268.8 c. inches.
1 barrel = 4½ cubic feet.	1 gallon U. S. = 8.34 lb.
8.665 cubic inches = 1 gill.	1 gallon U. S. = 231 cubic inches.
4 gills = 1 pint = 33.6 c. inches.	1 cubic foot = 7.48 U. S. gallons.

## DRY MEASURE.

1 barrel pork = 200 pounds.	8 gallons = 1 bushel.
1 barrel fish = 200 pounds.	64 gallons = 1 quarter.
1 barrel flour = 196 pounds.	1 bushel = 1.28 cubic feet.
1 barrel salt = 280 pounds.	1 cubic foot corn = 42 pounds.
1 barrel beef = 200 pounds.	1 cubic foot rice = 48 pounds.
1 bushel corn = 56 pounds.	1 cubic foot hops = 27 pounds.
1 bushel oats = 30 to 33½ pounds.	1 carload = 680 bushels.
1 bushel wheat = 60 pounds.	1 c. foot Anthr. coal = 54 lbs.
1 bushel potatoes = 60 pounds.	1 ton Anthr. coal = abt. 40 c. ft.
2 gallons = 1 peck.	

## PAPER.

24 sheets = 1 quire.	21½ quires = 1 ream printers'.
20 sheets = 1 quire outsides.	2 reams = 1 bundle.
25 sheets = 1 quire printers.	10 reams = 1 bale.
20 quires = 1 ream.	60 skins = 1 roll of parchment.

## WEIGHTS AND MEASURES—LINEAL MEASURE.

2¼ inches = 1 nail.	4 poles or 22 yards = 1 chain.
4 inches = 1 hand.	220 yards or 40 poles = 1 furlong.
3 inches = 1 palm.	1760 yards or 8 furlongs = 1 mile.
9 inches = 1 span.	7.92 inches = 1 link.
12 inches = 1 foot.	100 links or 66 ft. = 1 chain.
45 inches = 1 ell.	10 chains = 1 furlong.
3 feet = 1 yard.	80 chains = 1 mile.
6 feet = 1 fathom.	3 miles = 1 league.
16½ feet or 5½ yards = 1 rod, pole, or perch.	240 yards = 1 cable length.
	6086.07 feet = 1 knot or sea mile.

## LENGTH OF A FOOT IN DIFFERENT COUNTRIES.

	Inches.		Inches.
Spain .....	11.03	Denmark .....	12.35
Holland .....	11.14	Prussia .....	12.36
Sweden .....	11.14	Austria .....	12.45
America .....	12	Portugal .....	12.96
England .....	12	Russia .....	13.75

## LENGTH OF A MILE IN DIFFERENT COUNTRIES.

	Am. yards.		Am. yards.
Russian .....	1,100	Spanish .....	5,028
Italian .....	1,467	German .....	5,866
English .....	1,760	Swedish and Danish.....	7,233
American .....	1,760	Hungarian .....	8,630
Scotch .....	1,984	Norwegian .....	12,400
Irish .....	2,200	French league .....	3,666
Polish .....	4,400		

## SQUARE MEASURE.

144 square inches = 1 square foot.  
 9 square feet = 1 square yard.  
 272 $\frac{1}{4}$  feet = 1 square rod or pole.  
 40 rods = 1 square rood.  
 4 rods  
 160 rods  
 4,840 yards.  
 43,560 feet  
 10 square chains  
 640 acres = 1 square mile.

2,471 acres = 1 hectare.  
 7,840 square yards = 1 Irish acre.  
 6150 square yards = 1 Scotch acre.  
 30 square acres = 1 yard of land.  
 100 acres = 1 hide of land.  
 40 hides = 1 barony.  
 36 sq. miles = 1 township.  
 640 acres = 1 section.  
 About 14 25x125 ft. lots = 1 acre.

## SOLID OR CUBIC MEASURE.

1728 cubic inches = 1 cubic foot.  
 27 cubic feet = 1 cubic yard.  
 40 cubic feet of rough or 50 cubic feet  
 of hewn timber = 1 ton or load.

108 cubic feet = 1 stack of wood.  
 128 cubic feet = 1 cord of wood.  
 40 c. ft. = 1 U. S. A. shipping ton.  
 42 c. ft. = 1 British shipping ton.

## AVOIRDUPOIS WEIGHT.

16 drachms = 1 ounce.  
 16 ounces = 1 pound.  
 28 pounds = 1 quarter.

112 pounds = 1 cwt.  
 20 cwt. = 1 ton.

## TROY WEIGHT.

24 grains = 1 dwt.  
 20 dwt. = 1 oz.

12 oz. = 1 lb.

## SIZES OF PAPER (Whatman's).

Foundations—See General Provisions.	
.....	980 to 991
Walls—Around stairs, elevators and shafts .....	998
Ledges, etc.....	997
Reinforced concrete .....	960
Window Cleaning—Safety devices....	1145

## CLASS VIII.

Buildings Used Exclusively for Schools.	
(Sections 800 to 899, inc.)	

	A	
Aisles and Cross Aisles—In class and recitation rooms—Width of.....	819	
Passageways—Kept clear and unobstructed .....	820	
Width of in auditorium—Number of seats .....	818	
Alterations—When may be executed in same kind of materials.....	801	

	B	
Basement—Definition of—Classrooms in—Prohibited .....	825	
Buildings of Class VIII.—Construction of (Kinds) .....	801	
Definition of .....	800	

	C	
Corridors, Passageways, Hallways and Doors—Width of .....	815	

	Section No.
<b>Doors</b> —From assembly halls and classrooms to other parts of building to be covered with metal or fireproof material .....	S17
To open outward—To be kept unlocked during occupancy .....	S16
Widths of .....	S15-S21

E	
<b>Emergency Exits</b> —For auditoriums or assembly rooms seating 800 or more—Must have—Least width of .....	S21
To be lighted .....	S23
<b>Exits</b> —Signs over (size of letters)—Red lights required at night .....	S22

F	
<b>Fire Drill</b> —Required—How often—Record of to be kept—Janitor to participate .....	S27
School principal responsible for .....	S28
<b>Fire Escapes and Stairways on</b> —Four stories or over .....	S26
School janitor to examine—To be kept unobstructed .....	S27
<b>Floor Levels</b> —Height to be measured from sidewalk .....	S10
In buildings of fireproof construction .....	S07
In buildings of mill, slow-burning or ordinary construction .....	S09
In buildings having stairs and corridors fireproof .....	S08
<b>Frame Buildings</b> —Distance from nearest building—Location to be approved—Portable—One-story .....	S02
Roofs of—Interior woodwork—Fireproof painted .....	S02
<b>Foundations</b> —See General Provisions .....	S81-S82-S90

L	
<b>Loads</b> —Live loads on floors—Allowance for .....	S05

S	
<b>School Janitor</b> —Duties—Examine—Report .....	S27
<b>Seats</b> —Number in rows in auditoriums—How grouped .....	S18
<b>Stairways</b> —Enclosing walls—When to be fireproof .....	S14
Height of run to landings—Windings prohibited .....	S13
Least width—Number required—Width how computed—Limitations .....	S10
Railings required on each side .....	S12
<b>Stories Above Basement</b> —Least height .....	S06

V	
<b>Ventilation</b> —See "Windows" .....	S24

W	
<b>Walls</b> —Enclosing stairways and corridors .....	S14
Thickness of (table) .....	S04
Window openings in—On lot line .....	S03
<b>Windows</b> —Window area in rooms .....	S24

## REFERENCES.

<b>Doors and Windows</b> —When required to be closed—Fire-resisting glass .....	1049
---	------

<b>Downspouts, gutters and pipes</b> .....	1024-1025
<b>Walls</b> —Around stairs, elevators and shafts .....	998

## GENERAL PROVISIONS.

(Sections 900 to 1200, inc.)

A	
<b>Alterations and Changes</b> —Must conform to ordinance .....	1050
Ordinance—When retroactive or not .....	1051
<b>Approved Cinder Concrete Construction</b> —See "Concrete" .....	968
<b>Arches</b> —Segmental—Thickness and rise of .....	932-933

B	
<b>Balconies</b> —See "Porches" .....	1028
<b>Basements</b> —Definition of .....	1014
Openings in floors to be sealed .....	1016
Stairs in—Number of .....	1016
Sub-basement—Requirements .....	1016
Or stories under frame buildings .....	106S
<b>Bay Windows and Light Shafts</b> —Material for .....	1010-1025
<b>Beams</b> —Spandril—Girders—Lintel—Fireproofing of .....	914-928-929
And girders—Approved cinder concrete coverings .....	972
<b>Belting</b> —Shafting and gearing in buildings—To be protected .....	1093
<b>Billboards and Signs</b> —Alteration and repair of .....	1129
Cost of changes charged to owner .....	1130
Duty of Commissioner of Buildings—Inspection of .....	1131
Fees for permit—Cost of .....	1132
Height and distance from ground .....	1126
Must have permit to erect .....	1128-1129
Now existing—To be altered to comply with ordinance .....	1130
On buildings—Plans and specifications submitted .....	1124
Size—Construction and exception .....	1125
To be approved by Commissioner of Buildings .....	1124-1129
<b>Billboards and Signs</b> —Unsafe condition—Notice to owner—When to be torn down .....	1131
Violations—Penalty .....	1133
Wood construction—Size .....	1127
<b>Blacksmith Shops</b> —Special consent .....	1111
<b>Block</b> —City—Definition .....	1108
<b>Blocks</b> —Concrete and hollow tile—When may be used .....	961
<b>Board of Examiners</b> —Duties and requirements .....	900
<b>Boilers</b> —Ceilings over—Protection .....	1043
Floors under—Protection .....	1042
Location of—Permit for—Space between ceilings and walls .....	1044
<b>Bolts</b> —To be turned—Holes reamed .....	943
<b>Bond</b> —Indemnifying—For occupation of streets—Filed with Commissioner of Public Works .....	1123
<b>Boxes</b> —Cut out—Switch—Chases .....	930
<b>Bracing</b> —Temporary during building operations .....	942
Wind pressure—Precautions, etc. ....	1013

	Section No.
<b>Breweries</b> —Special consent .....	1111
<b>Brick</b> —Burnt clay, tiles, etc.—How applied .....	905
Piers — Offsets — Bond and cap stones .....	1000
Walls—Stone facings of.....	1001-1002
Work—Laying and bonding (load). ..	996
Work—Pressed brick facing—Bond joints .....	999
<b>Building Materials</b> —Substitute for present "Fireproof"—When and how may be used.....	900
Shall conform .....	979
<b>Buildings</b> —Of fireproof construction—Definition .....	901
Of slow-burning construction—Definition .....	962
Of mill construction—Definition....	965
Of ordinary construction—Definition ..	977
All classes—Floor areas—Computation of—Stairs in.....	1012
Built, altered or repaired—Violations of .....	1155
Built, altered or repaired—Violations—Penalty .....	1157
Construction or alteration of.....	978
Existing—Alterations in—When required—When not required.....	1051
Expenses of altering by city—Recoverable from owner.....	1156
For storage of oils.....	1135
Limit of height .....	1011
Location of tanks for oils.....	1137
Not to be changed without conforming to ordinance.....	1050
Not to encroach on sidewalks.....	1029
Of approved cinder concrete—Construction .....	968
Operations —Scaffolds —Temporary floors .....	1147
Operations—Derricks and Tackles —Temporary bracing .....	942
Violations—Penalty .....	1148
When required to have fire escapes.....	1094

## C

<b>Cast Iron</b> —Stresses and Strains (table) .....	1003
<b>Ceilings</b> —Over boilers—Furnaces (protection) .....	1043
<b>Cellar</b> —Definition .....	1015
Sub—Requirements .....	1016
<b>Cements</b> —Method of testing.....	951
<b>Changes and Alterations of Buildings</b> —Must conform to ordinance.....	1050
<b>Chimneys</b> —External—Location of....	1036
External—Built of iron or steel....	1037
Flues—Linings of .....	1034
Framing around (wood) .....	1035
Height above roofs—More than 260 square inches .....	1033
Height above roofs—260 square inches or less.....	1031
Interior—Walls of .....	1032
Internal—Of metal .....	1034
Isolated .....	1038
In frame buildings—Flues through partitions .....	1066
Walls of and area.....	1030

Or smoke stacks—Foundations of.....	1039
<b>City Fire Limits</b> .....	1105-1107
<b>City</b> —Power to recover expense of altering buildings .....	1156
<b>Coal Sheds</b> —Along railroad tracks....	1071
<b>Columns</b> —Exterior—Approved cinder concrete covering .....	971
Exterior—Coverings to be applied direct to metal—How protected....	912
Exterior—Of reinforced concrete ..	957
Exterior—Pipes not to be enclosed with .....	924
Exterior—Protection of fireproofing.....	923-971
Interior—Approved cinder concrete covering .....	971
Interior—Coverings of—Thickness—How applied .....	920
Interior—Of reinforced concrete....	957
Interior—Pipes not to be enclosed with .....	924
Interior—Protection of fireproofing.....	923-971
Interior—Wiring clay tiles on.....	922
Open or lattice—To be filled with concrete .....	920
Lintels of store fronts.....	1020
<b>Commissioner of Buildings</b> —Opinion as to unsafe buildings—Power....	1156
Power to pass upon fireproof construction and materials.....	900
Power to enforce changes in existing buildings .....	1051
Power to tear down billboards and signs .....	1131
Special consents to be filed with.....	1072-1109-1111-1112
To approve plans for billboards and signs .....	1128
To keep record of proceedings of board of examiners .....	900
Other powers—See "Com. of Bldgs." in individual classes.	
<b>Concrete</b> —Approved cement—Specifications .....	903
Approved cinder—Definition, etc....	968
Approved cinder—Coverings for beams and girders.....	972
Approved cinder—Fireproof.....	902
Approved cinder—Coverings for columns .....	971
Approved cinder—Use of buildings of fireproof or ordinary construction .....	968
Approved cinder—Floor constructions—Slab and arches.....	972-973-974
Approved cinder—Floor constructions—reinforced with steel.....	974
Approved cinder—Partitions—Requirements .....	975
Approved cinder—Specifications for.....	969-970
Approved cinder—Walls (enclosing) ..	976
Blocks—When prohibited.....	904
Blocks and hollow tiles—When may be used .....	961
Cinder—For floor fillings—Specifications .....	908

	Section No.
Reinforced concrete—Definition of.....	947 to 950
Solid cement concrete walls.....	1008
Stairs—How built.....	938
<b>Construction—Fireproof—Definition of</b>	901
Slow burning—Definition of.....	962
Mill—Definition of.....	965
Ordinary—Definition of.....	977
Use of derricks, tackles, etc.—Temporary bracing.....	942
Coping—For walls and roofs.....	919
<b>Cornices and Gutters on fireproof buildings (supports of).....</b>	946
<b>Cornices and Gutters, Eaves and Bay Windows (supports of).....</b>	1025
<b>Courts—Light shafts—When required to have windows with fire-resisting glass, etc.....</b>	1049
<b>Contractor's License—Requirements.....</b>	1151 to 1154
<b>Coverings for Joists and Girders (slow burning).....</b>	962
<b>Cupolas of Foundries—Requirements.....</b>	1045
<b>Curb Walls—Exterior to be air and water tight.....</b>	995

## D

<b>Derricks—On sidewalks and streets—Limitation.....</b>	1119
Tackles and hoistways—Safety.....	942
Distilleries—Special consent.....	1111
<b>Domes, Towers and Spires—Construction of.....</b>	1026
<b>Doors, Windows, Sashes, etc. (fireproof buildings).....</b>	927-936
When required to be closed—Fire-resisting glass.....	1049
<b>Downspouts, Gutters and Pipes conveying water.....</b>	1024

## E

<b>Elevators—Passenger and Freight—Device—Efficient—To be approved.....</b>	1084
Doors on.....	1091
Enclosures of.....	1090
Fees—Permit and inspection.....	1076-1085-1087
Further safety devices.....	1078
Inspections to be made with test.....	1085
Inspections and fees.....	1087
Inspectors' duties.....	1082
Permit for installation.....	1076
Power to shut down.....	1083
Safety of employes.....	1093
Skylights over—Windows.....	1092
Testing of safety devices.....	1077-1078
Tests—Owner must permit.....	1079
Tests—Certificate furnished and posted.....	1080-1088
Tests—To be made semi-annually.....	1081
Without safety devices—Penalty.....	1078
Having sprinklers—Not required to be enclosed.....	1090
When not required to have safety devices.....	1086
Violations—Penalties.....	1076-1077-1078-1083
Freight—Hatch doors on.....	1089
<b>Elevators—Grain—Special consent required.....</b>	1111

	Section No.
<b>Electric Shut-off Device—Outside buildings—Approved by Fire Marshal—When not required.....</b>	1149
Penalty.....	1151

## F

<b>Factories—Special consent.....</b>	1111
<b>Fences—Height of.....</b>	1134
<b>Fire Escapes—Inspection and certificate on buildings four stories or over.....</b>	1094
Ladder—Anchors.....	1095
Anchors for top of standpipe.....	1101
Balconies.....	1096
In combination with standpipe.....	1097
Obstructions of.....	1056
Painting.....	1101
Permit—Cost of.....	1094
Specifications for.....	1095
Standpipes inside buildings.....	1099
Standpipes outside buildings.....	1098
Standpipes—Siamese.....	1100
Stairway—Erection—Location.....	1102
In fireproof office buildings.....	204
Inspection and fees—Cost of.....	1102-1103
Obstructions of.....	1056
Passing over windows and doors.....	1104
Permit to install—Cost of.....	1102
Plan to be approved by licensed architect—Specifications for—Three feet or over in width—Shall submit plans—When required.....	1102
Signs for—Continuously displayed—Limit of time to be posted—Location and size—Violations—Penalty.....	1103
<b>Fire Escapes and Stairs—Construction of—Changes of—Permit required</b>	1056
<b>Fire Escapes and Standpipes—When required.....</b>	1094
<b>Fire Limits—Of city—Exception from Provisional.....</b>	1105-6-7
<b>Fire Walls—See "Walls."</b>	
<b>Fireproof Buildings—Height of—Roof houses for elevators—Rise and limit of height.....</b>	944-5
Construction—Definition of term.....	901
Other than specified.....	900
<b>Fireproof Covering—Independent.....</b>	915
Measurements.....	909
Minimum thickness of.....	906
Material—Kinds of.....	902
<b>Floor Areas—Computation of—For all changes of buildings, etc.....</b>	1012
<b>Floor or Roof—Construction of approved concrete.....</b>	972-974
<b>Floor Filling—Cinder concrete.....</b>	908
<b>Flooring—Hollow tile.....</b>	932
Segmental arches.....	933
Fireproof construction.....	931 to 934
Load tests to be made.....	959
Under boilers—Furnaces—Protection of.....	1042
Wood nailing strips to be imbedded.....	934-974
Wood surfacing of.....	934
Live Loads, See Class I to Class VIII.	

	Section No.
<b>Foundations</b> —Brick piers of.....	996
Capacity of loads.....	980-983
Concrete—Safe loads .....	991-993
Construction and kinds of.....	981
Depth below surface—Least limit—	
Regulated by sewer—Exceptions..	990
In wet soil—Trenches to be drained.	988
Load for clay fifteen feet thick....	985
Load for sand fifteen feet thick....	986
Load for mixed soil.....	987
Mortar and concrete.....	991
Of chimneys and smokestacks.....	1039
Of dimension stones .....	994
Of new and old walls.....	982
Of rubble stones .....	995
Other than pile .....	984
Pile—Boring—Safe load required—	
How driven and protected—Load	
required—Fiber stress .....	983
Protection against frost.....	982
Safe loads of .....	983-993-994
Sewer and trenches required.....	988
Steel in—Concrete around base of	
columns .....	921
Steel rails or beams—In concrete..	992
Where not permitted .....	989
<b>Foundries</b> —Cupolas of—Requirements.	1045
Special consent .....	1111
<b>Frame Buildings</b> —Altering or Raising	
Permit required .....	1057
Basement or story beneath.....	1068
Carried to uniform height.....	1067
Changing gable or hip to flat roofs.	1063
Chimney flues—Through partitions.	1066
Cubic contents—Not to be enlarged.	1063
Damaged over 50 per cent....	1057-1064
Lot line—Requirements .....	1065
Moving from outside to inside fire	
limits—Prohibited .....	1113
Outside fire limits—Limit of height.	1060
Strength and construction .....	1058
Permit for moving—Requirements...	1113
Raising—Requirements .....	1063
Repairing and removal of—When	
prohibited .....	1064
Within fire limits—Altered—	
Changed to flats—Fire walls....	1061-2
Prohibited .....	1059
<b>Frame Grand Stands</b> —Within fire lim-	
its .....	1074
<b>Frame Sheds</b> .....	1069-1070-1071
<b>Frontage Consents</b> —Corner lot—How	
to be determined .....	1111
Definition of "City Block".....	1108
Required for erection of hospitals..	1109
Required for lumber or junk yards..	1072
Required for moving frame build-	
ings .....	1113
Required for reformatories and shel-	
tering institutions .....	1112
Required for stables, gas reservoirs,	
blacksmith shops, packing houses,	
factories, distilleries, elevators,	
junk shops, laundries, rendering	
and soap factories, tanneries and	
breweries .....	1111
<b>Furnace Pipes, Ducts, Etc.</b> —Material	
for .....	1048

	Section No.
For distribution of hot air.....	1046
<b>Furnace Registers</b> —For distribution of	
hot air .....	1047
<b>Furnaces</b> —Ceilings over—Protection..	1043
Floors under .....	1042
<b>Gas Shut-off</b> —To be approved by Fire	
Marshal—When not required—out-	
side building .....	1149
Penalty .....	1151
<b>Gas Reservoirs</b> —Special consent.....	1111
<b>Girders and Trusses</b> —Fireproofing of..	929
<b>Grand Stands</b> —Frame—Within fire	
limits (frontage consents).....	1074
<b>Cutters and Pipes</b> —From roofs.....	1024
Cornice on buildings over 100 feet	
in height .....	1025

## H

<b>Hoisting Apparatus</b> —In building con-	
struction—Safety of .....	1119
<b>Hospitals</b> —Construction and height—	
Limit .....	1109
Near school houses—Location of....	1110
Over two stories high—Fireproof	
—Permits and special consents....	1109
Written consents to be filed with	
Building Commissioner .....	1109
See "Hospitals," Class II.	
<b>Hotels and Lodging House</b> —Three	
stories or over—Require inside	
standpipes .....	1099

## I

<b>Ice Houses</b> —Within fire limits—Con-	
struction of .....	1075
<b>Incombustible Materials</b> —Definition of.	907
<b>Iron</b> —Wrought and cast—Stresses and	
Strains .....	1003-1004
<b>Inspection of Structural Iron Work...</b>	942
<b>Inspection of Billboards and Signs...</b>	1131

## J

<b>Joists and Girders</b> —In slow burning	
constructions (coverings) .....	962
<b>Junk or Lumber Yards</b> —Location (con-	
sent)—License required .....	1072
<b>Junk Shops</b> —Special consent required.	1111

## L

<b>Laundries</b> —Special consent for .....	1111
<b>Licenses</b> —Contractor's— Application	
and conditions .....	1151-1152
For junk shops or lumber yards	
(consent) .....	1072
Issuance of same—Violation—Pen-	
alty .....	1153-4
<b>Lintels and Columns of Store Fronts.</b>	1020
<b>Loads</b> —Carrying loads of different	
soils .....	985-986-987
Carrying loads of foundations..	983-993-994
Live loads on floors—See "Loads,"	
Classes I. to VIII.	
<b>Load Tests</b> —To be made by contrac-	
tors (floors) .....	959
<b>Lot Line</b> —Requirements for frame	
buildings .....	1065
<b>Lumber or Junk Yards</b> —Location (con-	
sent)—License required .....	1072-1111
Where not to be piled.....	1073

M	Section No.
Mill Construction—Approved cinder concrete in.....	968 to 975
Columns, girders and beams—Protected .....	946-966
Definition of .....	965
Floors—Flat slab—And roofs of ..	972-974
Partitions around stairs, shafts, etc.—Incombustible .....	975
Partitions and elevator enclosures to be incombustible .....	966
Segmental arches .....	973
Stairs to be incombustible.....	967
Mortar—Frozen mortar and cements Prohibited—Specifications for.....	982-991
Mullions—Door or window—Fire-proofing of .....	913

O	
Obstructions of Stairs and Fire Escapes .....	1056
Oils—Amount permitted .....	1138
Buildings for storage of.....	1135
In transit, not to be kept near buildings .....	1139
Sale of—Regulated .....	1140
Tanks for storage of.....	1136
Open Shelter Sheds—Requirements.....	1070
Ordinance—Buildings—Violations of Penalty .....	1155-1157
City's prior rights retained.....	1160
Repeal of prior ordinances.....	1160
Style of—In effect.....	1161
When not retroactive.....	1051
Ordinary Construction—Definition of.....	977

P	
Packing Houses—Special consent....	1111
Partitions—In Fireproof buildings.....	935-936
In mill constructed buildings—Around stairs, etc.....	975
In slow burning buildings.....	963
Incombustible, except doors, windows, etc .....	937
Penalty—For violations of building ordinance .....	1157
Permits—For altering or raising frame buildings .....	1057
For erection of billboards or signs.....	1128
For erection of billboards or signs—Cost of .....	1132
For erection of boilers—When required .....	1044
For erection of tanks—When required .....	1055
For fire escapes—Ladder.....	1094
For fire escapes—Stairway.....	1102
For installation of elevators.....	1076
For moving frame buildings.....	1113
For occupation of streets for building purposes .....	1123
Petroleum—Storage of—See "Oils".....	1138
Pipes—Not to be enclosed in columns Exceptions .....	924
See "Furnace Pipes".....	1046-1048
And gutters—For conveyance of water—Shall have .....	1024
Plans of Trusses—To be submitted... ..	941
For billboards and signs.....	1128
Plates—Iron or Steel—Strength of....	916

	Section No.
Porches, Verandas, Porticos and Balconies—Construction of inside fire limits—Porticos .....	1028
Posts, Partitions and Elevator Enclosures in slow burning construction ..	963
Pressed brick Facings—How bonded, laid, etc.—Full bed of mortar.....	999
R	
Reformatories and Sheltering Institutions—Special consents .....	1112
Registers—Hot Air .....	1047-1048
Reinforced Concrete—Columns—How Made .....	957
Definition—Regulations, etc....	947
Mixing of—Test .....	950
Permission to erect .....	949
Sand, stone, slag or gravel.....	952-953
Shearing stress—Resistance .....	956
Steel rods to be staggered—Resistance .....	960
Stress—Tensile and fiber.....	955
Stress of—Formulas .....	948
Tests to be made by contractor....	959
Walls—Requirements .....	960
Wind pressure—Provisions .....	958
Rendering Plants—Special consents.....	1111
Repeal of Prior Ordinances and Exceptions .....	1160
Residences—Junk Yards—Consent required .....	1072
Lumber not to be piled or stored near .....	1073
Rivets—Machine driven— Requirements .....	940
Riveting—Of structural iron work— Skeleton .....	910
Roofs—Construction of—Pitch, etc.....	1022
Approved cinder concrete.....	972-974
Enclosure on—For tanks—Elevators—Skylights—Parapets and Balustrades .....	1017
For spectatorial purposes—Commissioner of Buildings to inspect....	1142
Fee for inspection .....	1143
Live loads on—Railings required.....	1142
Permits .....	1141
Violation—Penalty .....	1144
Gutters and downspouts.....	1024
On Fireproof buildings—Cornice and gutters of .....	946
Rise and height .....	945
Shingle or gravel .....	1021
Strength of .....	1023
Tanks on—Permit required—Support of .....	1055

S	
Safety Devices for Cleaning Windows—Penalty .....	1145-1146
Sale of Oils—See "Oils".....	1140
Sand—Torpedo .....	952
Scaffolds—During building operations Penalty .....	1147-1148
Shafting—Belting, etc., to be protected.....	1093
Shafts—Doors and windows in—Incombustible .....	927
Partitions around—Plastering of....	926
Through floors—How enclosed.....	925
Sheds—Coal—Along railroad tracks.....	1071

	Section No.
Frame—Requirements .....	1069
Open shelter—Height and walls....	1070
Sidewalks—Delivery of material—Elevated .....	1115
Occupation of by parts of buildings.	1029
Temporary roof—Strength of—Over—Time maintained .....	1116
Sidewalks and Streets—Derricks on—Limitation .....	1119
Excavated material and rubbish....	1118
Frontage—Adjacent—Occupied for building purposes .....	1120
Occupation of .....	1114
Signs—See “Billboards” .....	1124
Display cards for strength of floors..	117
Fire escape—General .....	1103
Exit—See “Exit Signs,” Classes IV., V., VII. and VIII.	
Skeleton Construction—Definition of—Members shall be riveted .....	910
Enclosing walls .....	911
Skylights—Construction—Glass in—Wire mesh over .....	1027
Slow Burning Construction—Approved cinder concrete in.....	968-975
Definition of .....	962
Partitions around elevators, stairs and shafts .....	963
Posts, partitions, etc.....	963
Stairs to be incombustible.....	964
Smoke Flues—Passing through partitions .....	1040
Woodwork around—Protection of....	1041
Smoke Stacks—Foundations of .....	1039
Soap Factories—Special consent....	1111
Spire, Towers and Domes—Construction of .....	1026
Stables—Livery, boarding or sale—Special consent .....	1111
Stairs and Fire Escapes—Changes of Permit required—Construction of Obstructions of .....	1056
Stairs and Landings—In fireproof buildings—Specifications of solid concrete—How built .....	938
Stairways—Doors in buildings less than 100 feet high.....	1012
Essentials—See “Stairways,” Classes I to VIII.	
In mill construction buildings—Construction of .....	967
In ordinary construction buildings—See Classes I. to VIII.	
In slow burning construction buildings—Construction of .....	964
Standpipes—Inside buildings—Hotels and lodging houses over three stories .....	1099
Outside buildings .....	1098
Siamese connection .....	1100
When required .....	1094
Steel—Beams, girders and floor plates (in reinforced concrete).....	954-5
Stone—Crushed, slag or gravel.....	953
Stone Facing—With bond courses....	1002
Without bond courses .....	1001
Stone Bond or Cap, Offsets, etc.....	1000
Storage of Oils—See “Oils”.....	1138

	Section No.
Store Fronts—Columns and Lintels of.	1020
Streets—Obstructions, Permits, Bonds and fees .....	1123
Red lanterns to be displayed.....	1122
Storage of building materials—Limitations .....	1117
Use of for building purposes—When terminated .....	1121
Stresses—Fiber strains (cast iron)....	1003
Posts with flat ends.....	1006
Pounds per square inch—Iron and steel .....	1004
Timber—Pounds per square inch....	1005
Structural Metals—Painting .....	939
Steel and iron work—Bolts and rivets of .....	940-943
Riveting .....	940
To be inspected .....	942
Sub-Basement—Requirements .....	1016
T	
Tackles, Derricks and Hoistways—Safety of, etc.....	942-1119
Tanks—For storage of oils.....	1136
For oil, distance from buildings....	1137
Gas reservoirs—Location—Special consent .....	1111
Upon roofs—Enclosures of.....	1017
Supports of (beams)—Capacities of—Permits .....	1055
Walls around .....	1017-1037
Tanneries—Special consent required..	1111
Terra Cotta—For fireproofing—How applied .....	918
Tie Arches and Flooring.....	931-932-933
Tests—Cement—Method of .....	951
Concrete—Mixing of .....	950
Reinforced concrete—Strength of Floors—Contractor to make.....	959
Substitutes for fireproof materials—To be approved by Board of Examiners .....	900
Towers, Domes and Spires—Construction of .....	1026
Trusses, Girders and Beams—Fireproofing of .....	914-928-929
Riveting and bolting of.....	940-943
Plans of—To be submitted—Inspected .....	941-2
V	
Verandas—See “Porches” .....	1028
Violations—Billboards and signs—Penalty .....	1133
In general of building ordinance....	1155
Penalty .....	1157
W	
Walls—Anchoring—Increasing thickness of .....	1052
Around stairs and shafts—Thickness of .....	998
Brick—Bonding—Safe loads .....	996
Brick piers—Bond and cap stones..	1000
Cement concrete—Solid .....	1008
Concrete approved cinder .....	976
Concrete reinforced—Specifications.	960
Copings on—To be incombustible..	919-1018
Curb walls—Exterior to be air and water tight .....	995

	Section No.
During erection of—How braced.....	1054
Eight-inch—Height limit .....	1007
Enclosing walls in skeleton construction .....	911
Enclosing walls—Coverings for structural members .....	976
Fire walls—Copings on—Facing on streets, alleys, courts or shafts—Thickness and height of—When dispensed with .....	1018
Frozen mortar or cement prohibited.	982
Increasing thickness of (anchoring).	1052
Ledges—Joist supports .....	997
Of hollow concrete and tile blocks..	961
Party—When considered safe.....	1053
Pressed brick facings—How laid and bonded .....	999

	Section No.
Support of on skeleton construction, 917	
Stone facings—Ashler—Bonding, etc. ....	1001-1002
Thickness of .....	1009
Wind pressure—Precautions against.	1013
Windows and Doors—Fire-resisting glass—When required .....	1049
Window, Doors and Sashes—Fireproof buildings .....	927-936
Windows—Cleaning of—Safety device	
Violations of Penalties.....	1145-6
Window and Door Sills—Incombustible .....	1019
When required to be closed.....	1049
Wind Pressure—Precautions against...	1013

## It Helps Business

To have your Office Furnished with  
**Andrews' High Grade Office Fittings**  
**Andrews' Typewriter Desks**  
**Andrews' Typewriter Metal Chairs**  
**Andrews' Office Desk, medium to best**  
**Andrews' Bookkeepers' Desk and Chairs**

Also Mfrs. Bank, Church, School  
 and Theatre Furniture

**The A. H. Andrews Co.**

174 and 176 Wabash Avenue, Chicago

**Contractors' Supply & Equipment Co.**

OLD COLONY BUILDING, . . . CHICAGO

BRANCH HOUSES IN ALL PRINCIPAL CITIES

# CLASSIFIED LIST OF ADVERTISERS.

Advertisers are classified with the view to furnish Architects and others a ready reference list of houses engaged in the Building Business. It is requested that those using it will kindly mention this book in their correspondence.

## AIR COMPRESSORS.

Contractors Supply & Equipment Co., Old Colony Bldg.  
Fairbanks, Morse & Co., Franklin and Monroe.  
Scully Steel & Iron Co., Halsted and Fulton.

## AIR PURIFYING APPARATUS.

Thomas & Smith, 17-19 S. Carpenter St.

## AIR VALVES.

Davis, G. M. Regulator Co., 144-146 Milwaukee Av.

## ALTAR AND CHURCH FURNITURE

Andrews, A. H. Co., The, 174-176 Wabash.

## AMMONIA FITTINGS.

Vilter Mfg. Co., The, Milwaukee, Wis., and Monadnock Bldg., Chicago.  
Wolf, Fred W. Co., The, 139 Rees St.  
York Mfg. Co., 1060 Monadnock Block.

## ANDIRONS AND FIREPLACE FURNISHINGS.

Hoops, William H. & Co., 10-12 E. Monroe St.

## ANGLES AND CHANNELS.

Bolters, A. Sons, 84 La Salle St.  
Butler Street Foundry & Iron Co., 3422-32 Butler St.  
Globe Iron Works, Rector Bldg.  
Holmes, Pyott & Co., 13 N. Jefferson St.  
Illinois Steel Company, 50 Wabasha Av.  
Morava Construction Co., 1243 Marquette Bldg.  
Petersen, H. A., Mfg. Co., 407 Cham. of Com.  
Pietsch, Ferd., Structural Iron Works, Ashland, Bloomingdale & Marshfield Aves.  
Scully Steel & Iron Co., Halsted & Fulton Sts.  
South Halsted St. Iron Works, 135 Adams St.  
Union Foundry Works, First Nat'l Bank Bldg.  
Vanderpool Co., The, 497-505 W. 22nd St.  
Voss, Frederick, 617 to 621 Austin Av.

## ANNUNCIATORS AND BURGLAR ALARMS.

Moon Mfg. Co., 47 South Canal St.

## ARC LAMPS.

Stanley-G. I. Electric Mfg. Co., Monadnock.

## ARCHITECTS' SUPPLIES.

Abbott, A. H. & Co., 151-153 Wabash Av.  
Dietzgen, Eugene Co., 181 Monroe St.  
Keuffel & Esser Co., 111 Madison St.

## ARCHITECTURAL AND STRUCTURAL IRON AND STEEL.

American Bridge Co., 1315 Monadnock.  
Benner Mfg. Co., 110 W. Monroe St.  
Bolters, A. Sons, 84 La Salle St.  
Butler Street Foundry & Iron Co., 3422-32 Butler St.  
Central Iron Works of Chicago, 263-265 West Lake St.  
Globe Iron Works, Rector Bldg.  
Halsted, Joseph, 388 W. Randolph St.  
Hickey, M. H. Wire & Iron Works, 54 Dearborn St.  
Holmes, Pyott & Co., 13 N. Jefferson St.  
Illinois Steel Company, 50 Wabasha Av.  
Morava Construction Co., 1243 Marquette Bldg., Muth, Chr., 428 Blue Island Av.  
Petersen, H. A., Mfg. Co., 407 Cham. of Com.  
Pietsch, Ferd., Structural Iron Works, Ashland, Bloomingdale & Marshfield Aves.  
Scully Steel & Iron Co., Halsted & Fulton Sts.  
Smith, F. P. Wire & Iron Works, 100 Lake St.  
South Halsted St. Iron Works, 135 Adams St.  
Union Foundry Works, First Nat'l Bank Bldg.  
Vanderpool Co., The, 497-505 W. 22nd St.  
Voss, Frederick, 617 to 621 Austin Av.

## ARCHITECTURAL IRON WORK.

American Bridge Co., 1315 Monadnock.  
Bolters, A. Sons, 84 La Salle St.  
Globe Iron Works, Rector Bldg.  
Halsted, Joseph, 388 W. Randolph St.  
Heath-Johnson Co., 141-143 Ontario St.  
Holmes, Pyott & Co., 13 N. Jefferson St.  
Muth, Chr., 428 Blue Island Av.  
Petersen, H. A., Mfg. Co., 407 Cham. of Com.  
South Halsted St. Iron Works, 135 Adams St.  
Union Foundry Works, First Nat'l Bank Bldg.

## ARCHITECTURAL SCULPTORS.

Architectural Decorating Co., 643 S. Jefferson St.  
Builders & Decorators Mfg. Co., 181 E. Division St.  
Decorators' Supply Co., The, Archer Av. & Leo St.  
Dux, Joseph, 132 W. Jackson Blvd.  
Hartmann, John, 13 N. Jefferson St.

## ARCHITECTURAL SHEET METAL ORNAMENTS.

Friedley-Voshardt Co., 194-204 Mather St.

## ARCHITECTURAL TERRA COTTA.

American Terra Cotta & Ceramic Co., The, 602 Chamber of Commerce Bldg.  
Northwestern Terra Cotta Co., The, 1415 Railway Exchange Bldg.

## ARMORED CONCRETE CONSTRUCTION.

Randolph, S. M., 1307, 188 Madison St.

## ARTISTS' MATERIAL.

Keuffel & Esser Co., 111 Madison St.

## ASBESTOS FIREPROOF LUMBER.

Johns-Manville Co., H. W., 173 Randolph St.

## ASBESTOS MANUFACTURERS.

Chicago Fire Proof Covering Co., 18 N. Canal St.  
Johns-Manville Co., H. W., 173 Randolph St.  
Western Roofing & Supply Co., 177 Randolph St.

## ASBESTOS-PIPE AND BOILER COVERING.

Chicago Fire Proof Covering Co., 18 N. Canal St.  
Johns-Manville Co., H. W., 173 Randolph St.  
Western Roofing & Supply Co., 177 Randolph St.

## ASPHALT FLOORS.

Brown, F. E. & Co., 1007 Chamber of Com.  
de Smet, Geo. W., Chamber of Commerce.  
Hoeffer & Co., Chamber of Commerce Bldg.  
McEvoy, Wm. P. & Co., 414 Reaper Block.  
Simpson Construction Co., 704 Cham. of Com.

## ASPHALT-FLOORS, PAVING, ROOFING.

Bird, F. W. & Son, 1434 Monadnock Bldg.  
Blome, Randolph S. Co., 79 Dearborn St.  
Brown, F. E. & Co., 1007 Chamber of Commerce Bldg.  
McEvoy, Wm. P. & Co., 414 Reaper Block.  
Standard Concrete Construction Co., 184 La Salle St.  
Stowell Mfg. Co., 47 Market St.

## AUTOMATIC FIRE SPRINKLERS.

Illinois Malleable Iron Co., 30 W. Monroe St.  
Phoenix Fire Extinguisher Co., First National Bank Bldg.

**AWNINGS-BRONZE, WOOD AND IRON.**  
Dodge, H. B. & Co., 525, 108 La Salle St.

## BANK AND OFFICE FIXTURES.

Andrews, A. H. Co., The, 174-176 Wabash Ave.

Booth, John, 14 and 16 N. Canal St.  
Chicago Bank & Office Fixture Co., 677-  
679 W. Van Buren St.  
Warren, William H. Mfg. Co., Blackhawk St.  
and Smith Ave.

**BANK AND OFFICE RAILINGS—METAL.**  
American Iron & Wire Wks, 575-581 Carroll Av.  
Baldwin Brass Works, 232-234 S. Clinton St.  
Booth, John, 14 and 16 N. Canal St.  
Brown Bros. Mfg. Co., 22d St. & Campbell  
Av.  
Heath-Johnson Co., 141-143 Ontario St.  
Hickey, M. H. Wire & Iron Works, 54 Dear-  
born St.  
Interior Woodworking Co., 296 Wabash Av.  
Smith, F. P. Wire & Iron Works, 100 Lake St.  
Standard Company, The, 810 Railway Ex-  
change Bldg.  
Voss, Frederick, 617 to 621 Austin Av.

### **BEAMS AND COLUMNS—IRON AND STEEL.**

Bolters, A. Sons, 84 La Salle St.  
Butler Street Foundry & Iron Co., 3422-32 But-  
ler St.  
Globe Iron Works, Rector Bldg.  
Halsted, Joseph, 388 W. Randolph St.  
Holmes, Pyott & Co., 13 N. Jefferson St.  
Illinois Steel Company, 50 Wabasha Av.  
Morava Construction Co., 1243 Marquette  
Bldg.  
Muth, Chr., 428 Blue Island Av.  
Petersen, H. A., Mfg. Co., 407 Cham. of Com.  
Pietsch, Ferd., Structural Iron Works, Ash-  
land, Bloomingdale & Marshfield Aves.  
Scully Steel & Iron Co., Halsted & Fulton Sts.  
Smith, F. P. Wire & Iron Works, 100 Lake St.  
South Halsted St. Iron Works, 135 Adams St.  
Union Foundry Works, First Nat'l Bank Bldg.  
Vanderpool Co., The, 497-505 W. 22d St.

**BELT AND HAND POWER ELEVATORS.**  
Contractors Supply & Equipment Co., Old Col-  
ony Bldg.

Otis Elevator Company, 9 Jackson Bldg.  
Reedy, J. W. Elevator Mfg. Co., 91 Illinois St.

### **BELTING.**

Morgan, H. B. Company, Grand Crossing.  
Street, R. R. & Co., 184-186 Washington St.  
Western Roofing & Supply Co., 177 Ran-  
dolph St.

### **BLACK PLATE.**

American Sheet & Tin Plate Co., Pittsburg,  
Pa.; First Nat'l Bank Bldg., Chicago, Ill.;  
Union Trust Bldg., Cincinnati, O.; Equi-  
table Bldg., Denver, Colo.; Penobscot Bldg.,  
Detroit, Mich.; Hennen Bldg., New Or-  
leans, La.; Battery Park Bldg., New York  
City; Pennsylvania Bldg., Philadelphia,  
Pa.; Ainsworth Block, Portland, Ore.;  
Union Trust Bldg., San Francisco, Cal.;  
Chemical Bldg., St. Louis, Mo.  
Scully Steel & Iron Co., Halsted and Fulton.

### **BLOWER REGULATORS.**

Davis, G. M. Regulator Co., 144-146 Milwau-  
kee Av.

### **BLUE AND BLACK PRINTING.**

American Blue Print Paper Co., 102-104 Van  
Buren St. and Railway Exchange Bldg.  
Crofoot, Nielsen & Co., 167 E. Washington  
St.  
Dietzgen, Eugene Co., 181 Monroe St.  
Keuffel & Esser Co., 111 Madison St.  
Shepard Blue Print Co., 215 Fifth Av.

### **BOILER AND GENERAL CASTINGS.**

Butler Street Foundry & Iron Co., 3422-32 But-  
ler St.

### **BOILER AND PIPE COVERING.**

Chicago Fire Proof Covering Co., 18 N. Canal St.  
Garden City Sand Co., The, 188 Madison St.  
Johns-Manville Co., H. W., 173 Randolph St.  
Western Roofing & Supply Co., 177 Ran-  
dolph St.

### **BOILER REPAIRS.**

Dinet, Joseph E., 14-16-18 Larrabee St.

### **BOILERS.**

Arcade Steam Heating Co., 70 La Salle Av.  
Contractors Supply & Equipment Co., Old Col-  
ony Bldg.  
Dawson, A. L. & Co., 27-29-31 W. Washington.  
Illinois Malleable Iron Co., 30 W. Monroe St.  
Kaestner, Chas. & Co., 241-261 S. Jefferson St.  
Kehm Bros. Co., 226 E. Kinzie St.  
Street, R. R. & Co., 184-186 Washington St.

### **BOILERS—STEAM AND HOT WATER.**

Davis Construction Co., 41 Dearborn St.  
Deppmann, A. & Co., 212 Illinois St.  
Dilzer, Fred, 48 Dearborn St.  
Fairbanks, Morse & Co., Franklin and Monroe.  
Illinois Malleable Iron Co., 30 W. Monroe St.  
International Heater Co., 48 Dearborn St.  
Kehm Bros. Co., 226 E. Kinzie St.  
Kewanee Boiler Company, 167 Lake St.  
Kroeschel Bros. Co., 55 Erie St.  
Norton, F. J., 8 North State St.  
Western Valve Co., 41-43 W. Randolph St.  
Wilks, S. Mfg. Co., 85th St. & Shields Av.

### **BONDS—SECURITY.**

Burrows, Marsh & McLennan, 159 La Salle.  
Williams, George, 419 Chamber of Com.

### **BOTTLING OUTFITS.**

Vilter Mfg. Co., The, Milwaukee, Wis., and  
Monadnock Bldg., Chicago.

### **BRASS AND COPPER TUBES.**

Chicago Brass Company, 166 Lake St.

### **BRASS AND IRON—ARCHITECTURAL.**

American Iron & Wire Wks, 575-581 Carroll Av.  
Baldwin Brass Works, 232-234 S. Clinton St.  
Brown Bros. Mfg. Co., 22d St. & Campbell  
Av.

Chicago Ornamental Iron Works, 37th St. and  
Stewart Av.

Heath-Johnson Co., 141-143 Ontario St.  
Hickey, M. H. Wire & Iron Works, 54 Dear-  
born St.  
Smith, F. P. Wire & Iron Works, 100 Lake St.  
Standard Company, The, 810 Railway Exchange  
Bldg.

Voss, Frederick, 617 to 621 Austin Av.

### **BRASS GOODS.**

Chicago Brass Company, 166 Lake St.  
Dawson Bros., 197-207 N. Halsted St.  
Heath-Johnson Co., 141-143 Ontario St.

### **BRASS, IRON AND WIRE.**

Booth, John, 14 and 16 N. Canal St.  
Halsted, Joseph, 388 W. Randolph St.  
Hickey, M. H. Wire & Iron Works, 54 Dear-  
born St.  
Smith, F. P. Wire & Iron Works, 100 Lake St.  
Standard Company, The, 810 Railway Ex-  
change.

### **BRASS MANUFACTURERS.**

Chicago Brass Company, 166 Lake St.

### **BREWERS' MACHINERY.**

Vilter Mfg. Co., The, Milwaukee, Wis., and  
Monadnock Bldg., Chicago.

### **BREWERY AND MALT HOUSE CON- STRUCTION.**

Kaestner, Chas. & Co., 241-261 S. Jefferson St.

### **BRICK BUILDING RAISERS AND MOVERS.**

Friestedt, L. P., Co., 1526-28 Tribune Bldg.  
Sheeler H., & Son, 716 Cham. of Com. Bldg.

### **BRICK—COMMON.**

Calumet Brick Co., 323 Cham. of Com.  
Knickerbocker Ice Co., 171 La Salle St.  
Labahn Brick Co., 92 and 94 La Salle St.  
Moulding, Thomas Co., Chamber of Commerce.  
National Brick Co., 84 La Salle St.  
Wisconsin Lime & Cement Co., 607 Cham-  
ber of Commerce.

### **BRICK—ENAMELED.**

Bonner & Marshall Co., 1107 Chamber of Com.  
Jenkins & Reynolds Co., The, 1210 Cham. Com.  
Kimball, S. S., Brick Co., 304 Cham. of Com.

### BRICK-FIRE.

Garden City Sand Co., The, 188 Madison St.  
Jenkins & Reynolds Co., The, 1210 Cham. Com.  
Moulding, Thomas Co., Chamber of Commerce.  
Portsmouth, Harbison-Walker Company, The,  
1205 Chamber of Commerce.  
Wisconsin Lime & Cement Co., 607 Cham-  
ber of Commerce.

### BRICK-ORNAMENTAL AND PLAIN.

Portsmouth, Harbison-Walker Co., The, 1205  
Chamber of Commerce Bldg.

### BRICK-PAVING.

Bonner & Marshall Co., 1107 Chamber of Com.  
Garden City Sand Co., The, 188 Madison St.  
Moulding, Thomas Co., Chamber of Commerce.

### BRICK-PRESSED.

Bonner & Marshall Co., 1107 Chamber of Com.  
Jenkins & Reynolds Co., The, 1210 Cham. Com.

South Halsted St. Iron Works, 135 Adams St.  
Union Foundry Works, First Nat'l Bank Bldg.  
Voss, Frederick, 617 to 621 Austin Av.

#### KALSOmine.

Moore, Benjamin, & Co., 111-117 N. Green St.  
Muralo Co., The, 24 Market St.  
Rubber Paint Company, 150-156 W. Van Buren.

#### LAMP FIXTURES.

Federal Electrical Co., 128 W. Lake St.

#### LATH

Hettler, Herman H., Lumber Co., 1324 Elston Ave.

#### LATH—METAL AND WIRE.

Booth, John, 14 and 16 N. Canal St.  
General Fireproofing Co., The, 315 Old Colony Bldg., Chicago; 212 Federal Bldg., Youngstown, Ohio.  
Northwestern Expanded Metal Co., Old Colony Bldg.  
Roebeling Construction Co., The, 906 Tribune Bldg.  
Voss, Frederick, 617 to 621 Austin Av.  
Wheeling Corrugating Co., 45-47 Lake St.  
Wisconsin Lime & Cement Co., 607 Chamber of Commerce.

#### LAUNDRY DRYERS.

Chicago Clothes Dryer Works, 346-348 Wabash Av.

#### LAUNDRY MACHINERY.

Chicago Clothes Dryer Works, 346-348 Wabash Av.  
Dawson, A. L. & Co., 27-29-31 W. Washington.

#### LAUNDRY TRAYS AND KITCHEN SINKS.

Alberene Stone Co., 56 N. Clinton St.

#### LIME.

Builders' Material Co., 606 Cham. of Com.  
Meacham & Wright, 308-09 Chamber of Com.  
Knickerbocker Ice Co., 171 La Salle St.  
Schultz, F., 658 S. Halsted St.  
Wisconsin Lime & Cement Co., 607 Chamber of Commerce.

#### LINK BELTING.

Brown Hoisting Machinery Co., The, Cleveland, Ohio.  
Jeffrey Mfg. Co., Monadnock Bldg., and Columbus, Ohio.  
Link Belt Machinery Co., 39th St. and Stewart Av.  
Webster Mfg. Co., 1075 W. 15th St.

### LOANS.

Balrd & Warner, 90 La Salle St.  
Greenebaum Sons, 83-85 Dearborn St.

### LOCKERS.

Dodge, H. B. & Co., 525-108 La Salle St.

### LOCKERS—SHEET STEEL.

Churchill & Spalding, 464-478 Carroll Ave.

### LOCKERS—VENTILATED.

Flexifold Door & Shutter Co., 160 Fifth Av.,  
New York.

### LUMBER.

Chandler Lumber Company, 100 Elston Av.  
Hettler, Herman H. Lumber Co., 1324 Elston.  
Mears, Chas. H. & Co., 1103 Belmont Ave.  
Paine Lumber Co., Chamber of Commerce.  
Pilsen Lumber Co., The, Laflin & 22d St.  
Rittenhouse & Embree Co., 3500 Center Av.

### LUMBER—KILN DRIED.

Chandler Lumber Company, 100 Elston Av.  
Pilsen Lumber Co., The, Laflin & 22d St.  
Rittenhouse & Embree Co., 3500 Center Av.

**LUMBER—YELLOW PINE—LONG LEAF.**  
Hettler, Herman H. Lumber Co., 1324 Elston.  
Pilsen Lumber Co., The, Laflin and 22d St.

### MACHINISTS.

Brown Hoisting Machinery Co., The, Cleve-  
land, Ohio.  
Contractors Supply & Equipment Co., Old Col-  
ony Bldg.  
Jeffrey Mfg. Co., Monadnock Bldg., and Colum-  
bus, Ohio.  
Kaestner, Chas. & Co., 241-261 S. Jefferson St.  
Link Belt Machinery Co., 39th St. and Stew-  
art Av.  
Webster Mfg. Co., 1075 W. 15th St.  
Weller Mfg. Co., 118 East North Ave.  
Wolf, Fred W. Co., The, 139 Rees St.  
York Mfg. Co., 1060 Monadnock Block.

### MACHINISTS' AND MANUFACTURERS' SUPPLIES.

Contractors Supply & Equipment Co., Old Col-  
ony Bldg.

### MANTELS.

Dawson Bros., 197-207 N. Halsted St.  
Hoops, William H. & Co., 10-12 E. Monroe St.

**MANTELS—WOOD, BRICK AND TILE.**  
Dawson Bros., 197-207 N. Halsted St.  
Hoops, William H. & Co., 10-12 E. Monroe St.

### MARBLE WORKERS AND DEALERS.

Caretti, John, & Co., 47 W. Lake St.  
Dawson Bros., 197-207 N. Halsted St.  
Marthens, Chester N., Marble Co., 748 First  
Nat'l Bank Bldg.  
Sherman-Flavin Marble Co., 2505-2509 State  
St.

### MASON CONTRACTORS.

Angus Bros. & Co., 908 Security Bldg.  
Appel, Henry, & Son, 710 Teutonic Bldg.  
Bulley & Andrews, 411, 115 Dearborn St.  
Bushnell, Carl, 217 Cham. of Com.  
Campbell, Arch. M., R. 23, 132 La Salle St.  
Clark C. Everett Co., 1405, 100 Washington St.  
Clark Construction Co., Suite 69, 4 Sherman  
St.  
Cullen, Frank J., 617 Chamber of Commerce.

American Engineering Specialty Co., 1510 Monadnock Blk.  
Consolidated Engineering Co., 42 W. Jackson Blvd.  
Davis, G. M. Regulator Co., 144-146 Milwaukee Av.

### VARNISHES.

American Varnish Co., 315 North Branch.  
Berry Bros., 15 Lake St. and Detroit, Mich.  
Moore, Benjamin, & Co., 111-117 N. Green St.  
Murphy Varnish Co., 22nd and Dearborn Sts.  
Noake-Wheeler-Clough Co., 377-391 Illinois St.  
Pratt & Lambert, 370 26th St.  
Standard Varnish Works, 2620 Armour Av.

### VAULT DOORS.

Donnell Safe Co., 52-54 Wabash Av.  
Harris, S. H. Co., The, 29 Pearce St.

### VAULTS-BANK.

Dornell Safe Co., 52-54 Wabash Av.  
Harris, S. H. Co., The, 29 Pearce St.

### VENETIAN BLINDS.

Dodge, H. B. & Co., 525, 108 La Salle St.

### VENTILATORS FOR WINDOWS.

Anti-Dust-and-Draft Ventilator Co., 622 Pullman Bldg.

### VENTILATING APPARATUS.

Chicago Edison Co., 139 Adams St.  
Deppmann, A. & Co., 212 Illinois St.  
Graves, W. B., 45 E. Lake St.  
Kehm Bros. Co., 226 E. Kinzie St.  
Kirk, Geo. H., 6612 Wentworth Av.  
Phillips-Getschow Co., 184 Indiana St.  
Prentice, L. H. Company, 24-26 Sherman St.  
Thomas & Smith, 17-19 S. Carpenter St.

### VENTILATORS.

Ritter, E. W., & Co., 601 Monadnock Blk.

### WALL COPING.

Garden City Sand Co., The, 188 Madison St.  
Northwestern Terra Cotta Co., The, 1415 Railway Exchange Bldg.

### WALL DECORATIONS.

Moore, Benjamin, & Co., 111-117 N. Green St.

### WALL PLASTER.

Garden City Sand Co., The, 188 Madison St.  
Michigan Plaster Co., 637-641 The Rookery.  
United States Gypsum Co., 200 Monroe St.  
Wisconsin Lime & Cement Co., 607 Chamber of Commerce.

### WALL SAFES.

Gross, H. H., & Son, 1328 First Nat'l Bank Bldg.

### WARDROBES-STEEL.

Churchill & Spalding, 464-478 Carroll Ave.

### WARDROBES-VENTILATED.

Dodge, H. B. & Co., 525, 108 La Salle St.  
Flexifold Door & Shutter Co., 160 Fifth Av., New York.

### WATER FILTERS.

Pittsburgh Filter Mfg. Co., Pittsburgh, Pa.

### WATERPROOFING.

Morgan, H. B., Co., Grand Crossing.  
Winslow, E. J., Co., 138 Jackson Blvd.

### WATER PURIFIERS.

Pittsburgh Filter Mfg. Co., Pittsburgh, Pa.

### WATER WORKS, STEAM, ELECTRIC AND GAS HEATING PLANTS.

Schott, W. H., 1100, 1128 Amer. Trust Bldg.  
Thompson, J., & Son Mfg. Co., Monadnock Block.

### WATER AND STEAM BOILERS.

Arcade Steam Heating Co., 70 La Salle Av.  
Ideal Heating Co., 6312 Wentworth Av.

### WIND MILLS.

Fairbanks, Morse & Co., Franklin and Monroe.

### WINDOW BLINDS-COILING-LIGHT-PROOF.

Flexifold Door & Shutter Co., 160 Fifth Av., New York.

### WINDOW VENTILATORS.

Anti-Dust-and-Draft Ventilator Co., 622 Pullman Bldg.

### WINDOWS-WIRE GLASS.

Bremer & Bielenberg, 1136 W. 13th St.  
McFarland, J. C. & Co., 27th St. and 5th Av.  
Miller, James A. & Bro., 129 S. Clinton St.  
Volgtman & Company, 42-54 E. Erie St.

### WIRE CLOTH.

Booth, John, 14 and 16 N. Canal St.  
Roebbling Construction Co., The, 906 Tribune Bldg.  
Smith, F. P. Wire & Iron Works, 100 Lake St.

#### **WIRE FENCE AND RAILINGS.**

Booth, John, 14 and 16 N. Canal St.  
Hickey, M. H. Wire & Iron Works, 54 Dearborn St.

#### **WIRE GLASS.**

Bremer & Bielenberg, 1136 W. 13th St.  
Voigtman & Company, 42-54 E. Erie St.

#### **WIRE GUARDS AND SCREENS.**

Hickey, M. H. Wire & Iron Works, 54 Dearborn St.  
Standard Company, The, S10 Railway Exchange.

#### **WIRE SASH AND FRAMES—GLAZED.**

Bremer & Bielenberg, 1136 W. 13th St.  
McFarland, J. C. & Co., 27th St. and 5th Av.  
Miller, James A. & Bro., 129 S. Clinton St.  
Voigtman & Company, 42-54 E. Erie St.

#### **WIRE WORK.**

American Iron & Wire Wks, 575-581 Carroll Av.  
Baldwin Brass Works, 232-234 S. Clinton St.  
Booth, John, 14 and 16 N. Canal St.  
Heath-Johnson Co., 141-143 Ontario St.  
Hickey, M. H. Wire & Iron Works, 54 Dearborn St.

Smith, F. P. Wire & Iron Works, 100 Lake St.  
Standard Company, The, S10 Railway Exchange.  
Voss, Frederick, 617 to 621 Austin Av.

#### **WOOD CARPET.**

Dunfee, J., & Co., 104-106 Franklin St.  
Newcomb, E. R., 14 E. Monroe St.

#### **WOOD CARVING.**

Architectural Decorating Co., 643 S. Jefferson.  
Builders & Decorators Mfg. Co., 181 E. Division St.  
Decorators' Supply Co., The, Archer Av. & Leo St.  
Dux, Joseph, 132 W. Jackson Blvd.  
Hartmann, John, 13 N. Jefferson St.

#### **WOOD COLUMNS.**

Sanders, Henry, Co., Elston & Webster Aves.

#### **WOOD MANTELS AND CONSOLES.**

Dawson Bros., 197-207 N. Halsted St.

#### **WOOD TURNING.**

Sanders, Henry, Co., Elston & Webster Aves.

#### **WRECKING, EXCAVATING, FILLING AND SODDING.**

Krug, S., 167 Dearborn St.
